

S700

Digital Servo Amplifier S748...S772

Instructions Manual

Translation of the original instructions. Edition 11/2009 Valid for Hardware Revision 01.01

Keep all manuals as a product component during the life span of the product.

Pass all manuals to future users / owners of the product.

1 General

1.1 About this manual

This manual describes the S748/772 series of digital servo amplifiers (standard version: 48A ...72A rated current). S701 to S724 amplifiers are described in an additional product manual.

A more detailed description of the expansion cards that are currently available and the digital connection to automation systems can be found, together with our application notes, in Acrobat-Reader format on the accompanying CD-ROM (system requirements: WINDOWS, Internet Browser, Acrobat Reader) in different languages.

Technical data and dimensional drawings of accessories such as cables, brake resistors, mains supplies, etc., can be found in the accessories manual.

This documentation can be printed out on any standard commercial printer. A printed copy of the documentation is available from us at extra cost.

More background information can be found in our "Product WIKI", available at www.servostar.de.

1.2 Target group

This manual addresses personnel with the following qualifications:

Transport: only by personnel with knowledge of handling electrostatically sensitive

components.

Unpacking: only by electrically qualified personnel. Installation: only by electrically qualified personnel.

Setup: only by qualified personnel with extensive knowledge of electrical

engineering and drive technology

The qualified personnel must know and observe the following standards:

IEC 60364 and IEC 60664

national accident prevention regulations

A WARNING

During operation there are deadly hazards, with the possibility of death, severe injury or material damage. The operator must ensure that the safety instructions in this manual are followed. The operator must ensure that all personnel responsible for working with the servo amplifier have read and understood the product manual.

1.4 Abbreviations used

Abbrev.	Meaning	
AGND	Analog ground	
xAF	Fuse, x Amps, fast	
xAM	Fuse, x Amps, medium	
xAT	Fuse, x Amps, slow	
BTB/RTO	Ready to operate	
CAN	Fieldbus (CANopen)	
CE	Communité Europeenne	
CLK	Clock signal	
COM	Serial interface for a Personal Computer	
DGND	Digital ground (for 24V and digital I/O)	
Disk	Magnetic storage (diskette, hard disk)	
EEPROM	Electrically erasable programmable memory

2 Safety

2.1 Safety Instructions

▲ DANGER

During operation there are deadly hazards, with the possibility of death, severe injury or material damage. Do not open or touch the equipment during operation. Keep all covers and cabinet doors closed during operation. Touching the equipment is allowed during installation and commissioning for properly qualified persons only.

- During operation, servo amplifiers may have uncovered live components, depending on their level of enclosure protection.
- Control and power connections may be live, even though the motor is not rotating.
- Servo amplifiers may have hot surfaces during operation.
 Surface can reach temperatures above 80°C.

A WARNING

There is a danger of electrical arcing with damage to contacts and personal injury. Never undo any electrical connections to the servo amplifier while it is live. Wait at least eight minutes after disconnecting the servo amplifier from the main supply power before touching potentially live sections of the equipment (e.g. contacts) or undoing any connections. Capacitors can still have dangerous voltages present up to ten minutes after switching off the supply power. To be sure, measure the voltage in the DC Bus link and wait until it has fallen below 40V.

▲ CAUTION

Incorrect handling of the servo amplifier can lead to personal injury or material damage. Read this documentation before carrying out the installation and commissioning. It is vital that you keep to the technical data and information on connection requirements (nameplate and documentation).

Only properly qualified personnel are permitted to carry out activities such as transport, installation, commissioning and maintenance. Properly qualified persons are those who are familiar with the transport, assembly, installation, commissioning and operation of the product, and who have the appropriate qualifications for their job. The qualified personnel must know and observe the following standards:

- IEC 60364 and IEC 60664
- national accident prevention regulations

A CAUTION

The manufacturer of the machine must produce a hazard analysis for the machine and take appropriate measures to ensure that unforeseen movements do not result in personal injury or material damage.

NOTICE

Check the Hardware Revision Number of the product (see product label). This revision number must match the Hardware Revision Number on the cover page of the manual.

NOTICE

The servo amplifiers contain electrostatically sensitive components which may be damaged by incorrect handling. Discharge your body before touching the servo amplifier. Avoid contact with highly insulating materials (artificial fabrics, plastic film etc.). Place the servo amplifier on a conductive surface.

2.2 Use as directed

- Servo amplifiers are safety components that are built into electrical plant or machines, and can only be operated as integral components of such plant or machines.
- The manufacturer of the machine must generate a hazard analysis for the machine, and take appropriate measures to ensure that unforeseen movements cannot cause injury or damage to any person or property.
- Servo amplifiers in the S748/772 series (overvoltage category III acc. to EN 61800-5-1) can be supplied from 3-phase grounded (earthed) industrial supply networks (TN-system, TT-system with grounded neutral point, no more than 42kA symmetrical rated current at 208V_{-10%}, 230V, 240V, 400V or 480V^{+10%}). Connection to other types of supply networks (with an isolating transformer) is described on page 54.
- Periodic overvoltages between phases (L1, L2, L3) and the housing of the servo amplifier must not exceed 1000V crest. In accordance with IEC 61800, voltage spikes (< 50μs) between phases must not exceed 1000V. Voltage spikes (< 50μs) between a phase and the housing must not exceed 2000V.
- If the servo amplifiers are used in residential areas, in business/commercial areas, or in small industrial operations, then additional filter measures must be implemented by the user.
- The servo amplifiers must only be operated in a closed control cabinet, taking into account the ambient conditions defined on page 26. Ventilation or cooling may be necessary to keep the temperature within the cabinet below 40°C.
- The S748/772 family of servo amplifiers is **exclusively** intended for driving suitable brushless synchronous servomotors and asynchronous motors with closed-loop control of torque, speed and/or position. The rated voltage of the motors must be at least as high as the DC bus link voltage divided by $\sqrt{2}$ produced by the servo amplifier $(U_{nMotor} \ge U_{DC}/\sqrt{2})$.
- Use only copper conductors for wiring. The conductor cross-sections can be derived from the standard IEC 60204 (alternatively for AWG cross-sections: NEC Table 310-16, 60°C or 75°C column).
- Consider the chapter "use as directed" on page 37 when you use the personnel safe restart lock STO. Consider the user documentations for safety cards S1 and S2 when you use the safety expansion cards.

2.3 Prohibited use

- Other use than described in chapter 2.2 is not intended and can lead to damage of persons, equipment or things.
- The use of the servo amplifier in the following environments is prohibited:
 - potentially explosive areas
 - environments with corrosive and/or electrically conductive acids, alkaline solutions, oils, vapours, dusts
 - directly on non-grounded supply networks or on asymmetrically grounded supplies with a voltage >240V.
 - on ships or off-shore applications
- Commissioning the servo amplifier is prohibited if the machine in which it was installed,
 - does not meet the requirements of the EC Machinery Directive
 - does not comply with the EMC Directive or with the Low Voltage Directive
 - does not comply with any national directives

3 Approvals

3.1 Conformance with UL

This servo amplifier is listed under UL file number **E217428**.

UL-certified servo amplifiers (Underwriters Laboratories Inc.) fulfil the relevant U.S. standards (in this case UL 840 and UL 508C).

This standard describes the fulfillment by design of minimum requirements for electrically operated power conversion equipment, such as frequency converters and servo amplifiers, which is intended to eliminate the risk of fire, electric shock, or injury to persons, being caused by such equipment. The technical conformance with the U.S. standard is determined by an independent UL inspector through the type testing and regular checkups.

Apart from the notes on installation and safety in the documentation, the customer does not have to observe any other points in direct connection with the UL-certification of the equipment.

UL 508C

UL 508C describes the fulfillment by design of minimum requirements for electrically operated power conversion equipment, such as frequency converters and servo amplifiers, which is intended to eliminate the risk of fire being caused by such equipment.

UL 840

UL 840 describes the fulfillment by design of air and insulation creepage spacings for electrical equipment and printed circuit boards.

3.1.1 UL Markings

- Use 60/75°C copper wire only for every model of this section.
- Tightening torque and wire size for field wiring terminals.
 X0 8-2 AWG, TQ Lb In. 40.
 X8 8-2 AWG, TQ Lb In. 40.
- For use in a pollution degree 2 environment only or equivalent.
- Suitable for use on a circuit capable of delivering not more than 42kA rms symmetrical amperes" for a max. Voltage of 480 Vac.
- For circuit protection see table below.

Model	Fuse class	Voltage Rating	Max. Fuse and SCC Rating
S748	RK5, CC, J, T	600V AC	60A / 200kA
S772	RK5, CC, J, T	600V AC	80A / 200kA

For use on a solidly grounded wye source only, or equivalent

3.1.2 **UL Certificate of Compliance**

Certificate of Compliance

Certificate Number 20091020-E217428 Report Reference E217428, 2009 October 16

Issue Date 2009 October 20

DANAHER MOTION GMBH Issued to:

> WACHOLDERSTR 40-42 40489 DUSSELDORF GERMANY

This is to certify that representative samples of POWER CONVERSION EQUIPMENT

Inverters (AC-servo drives), series S700, models S7480, and S7720, may be

followed by additional letters or numbers.

Have been investigated by Underwriters Laboratories Inc.® in accordance

with the Standard(s) indicated on this Certificate.

Standard(s) for Safety: Power Conversion Equipment, UL 508C 3rd edition.

See UL On-line Certification Directory at WWW.UL.COM for additional Additional Information:

information

Only those products bearing the UL Listing Mark should be considered as being

covered by UL's Listing and Follow-Up Service.

e UL Listing Mark generally includes the following elements: the symbol UL in a circle: with the word "LISTED"; a control number (may be alphanumeric) assigned by UL; and the product category name (product identifier) as indicated in the appropriate UL Directory.

Look for the UL Listing Mark on the product

3.2 EC conformance

Conformance with the EC Machine Directive 2006/42/EC, the EC EMC Directive 2004/108/EC and the Low Voltage Directive 2006/95/EC is mandatory for the supply of servo amplifiers within the European Community.

The servo amplifier meets the noise immunity requirements to the 2nd environmental category (industrial environment). For noise emission the amplifier meets the requirement to a product of the category C2 (motor cable \leq 10m).

NOTICE

This product can cause high-frequency interferences in non industrial environments. This can require measures for interference suppression like additional external EMC filters.

With a motor cable length of 10m or longer, the servo amplifier meets the requirement to the category C3.

The servo amplifiers have been tested by an authorized testing laboratory in a defined configuration, using the system components that are described in this documentation. Any divergence from the configuration and installation described in this documentation means that you will be responsible for carrying out new measurements to ensure conformance with regulatory requirements.

3.2.1 European Directives and Standards for the machine builder

Servo amplifiers are safety components that are intended to be incorporated into electrical plant and machines for industrial use. When the servo amplifiers are built into machines or plant, the amplifier must not be used until it has been established that the machine or equipment fulfills the requirements of the

EC Machinery Directive (2006/42/EG)
EC EMC Directive (2004/108/EC)
EC Low Voltage Directive (2006/95/EC)

Standards to be applied for conformance with the EC Machinery Directive (2006/42/EG)

IEC 60204-1 (Safety and Electrical Equipment in Machines)

ISO 12100 (Safety of Machines)

A CAUTION

The manufacturer of the machine must generate a hazard analysis for the machine, and must implement appropriate measures to ensure that unforeseen movements cannot cause injury or damage to any person or property.

The machine/plant manufacturer must check whether other standards or EC Directives must be applied to the machine/plant.

Standards to be applied for conformance with the EC Low Voltage Directive(2006/95/EC)

IEC 60204-1 (Safety and Electrical Equipment in Machines)

IEC 60439-1 (Low-voltage switchgear and controlgear assemblies)

Standards to be applied for conformance with the EC EMC Directive (2004/108/EC)

IEC 61000-6-1 / 2 (Interference Immunity in Residential & Industrial Areas)

IEC 61000-6-3 / 4 (Interference Generation in Residential & Industrial Areas)

The manufacturer of the machine/plant is responsible for ensuring that it meets the limits required by the EMC regulations. Advice on the correct installation for EMC can be found in this documentation.

We only guarantee the conformance of the servo system with the standards cited in this chapter if the components (motor, cables, chokes etc.) are those supplied by us.

3.2.2 EC Declaration of Conformity

EC Declaration of Conformity

KOLLMORGEN

Document No.: GL-11/31/22/09

We, the company

Danaher Motion GmbH Wacholderstraße 40-42 D-40489 Düsseldorf

hereby in sole responsibility declare the conformity of the product series

Servo drive \$748 / \$772

with the following standards:

- EC Directive 2004/108/EC
 Electromagnetic compatibility
 Used harmonized standard EN61800-3 (07/2005)
- EC Directive 2006/95/EC
 Electrical devices for use in special voltage limits
 Used harmonized standard EN61800-5-1 (04/2008)

Year of EC-Declaration 2009

Issued by: Product Manager Drives Europe

Holger Goergen

Düsseldorf, 25.05.2009

Legally valid signature

The above-mentioned company has the following technical documentation for examination:

Holy Gr

- Proper operating instructions
- Setup Software
- Diagrams / software source codes (for EU authority only)
- Test certificates (for EU authority only)
- Other technical documentation (for EU authority only)

The special technical product documentation has been created.

Responsible person for documentation: Lars Lindner, Phone: +49(0)203/9979-0

3.3 GOST-R conformance

Certificate for servo amplifiers and accessories (cover page).

4 Handling

4.1 Transport

• Transport by qualified personnel in the manufacturer's original recyclable packaging

Avoid shocks while transporting

Transport temperature: -25 to +70°C, max. rate of change 20K / hour
 Transport humidity: max. 95% relative humidity, no condensation

NOTICE

• The servo amplifiers contain electrostatically sensitive components, that can be damaged by incorrect handling. Discharge yourself before touching the servo amplifier. Avoid contact with highly insulating materials, such as artificial fabrics and plastic films. Place the servo amplifier on a conductive surface.

• If the packaging is damaged, check the unit for visible damage. In such an event, inform the shipper and the manufacturer.

4.2 Packaging

Recyclable cardboard with inserts

Dimensions: 390 x 600 x 400 mm

Labeling: name plate on outside of box

4.3 Storage

Storage only in the manufacturer's original recyclable packaging

Max. stacking height: 3 cartons

Storage temperature: -25 to +55°C, max. rate of change 20K / hour
 Storage humidity: 5 ... 95% relative humidity, no condensation

Storage duration:

Less than 1 year: without restriction.

More than 1 year: capacitors must be **re-formed** before setting up and operating the servo amplifier. To do this, remove all electrical connections and apply single-phase 230V AC for about 30 minutes to the terminals L1 / L2.

4.4 Maintenance, Cleaning

The devices do not require any maintenance, opening the devices invalidates warranty.

Cleaning: — if the casing is dirty: clean with Isopropanol or similar

NOTICE: Do not immerse or spray

- Dirt inside the unit: must be cleaned by the manufacturer
- For dirty protective grill on fan: clean with a dry brush

4.5 Disassembling

Observe the sequence below, if a servo amplifier has to be disassembled (e.g. for replacement).

1. Electrical disconnection

▲ WARNING

Switch off the main switch of the switchgear cabinet and the fuses that supply the system.

Wait at least ten minutes after disconnecting the servo amplifier from the main supply power before touching potentially live sections of the equipment (e.g. contacts) or undoing any connections. To be sure, measure the voltage in the DC Bus link and wait until it has fallen below 40V.

Remove the wiring. Disconnect the earth (ground) connection at last.

2. Check temperature

▲ CAUTION

During operation the heat sink of the servo amplifier may reach temperatures above 80°C (176°F). Before touching the device, check the temperature and wait until it has cooled down below 40°C (104°F).

3. Disassembling

Remove the fan housing and disassemble the servo amplifier (reverse of the procedure described in chapter "Mechanical installation).

4.6 Repair

Repair of the servo amplifier must be done by the manufacturer. Opening the devices means loss of the guarantee. Use the telefax form on page 135 for repair request. You'll receive the current dispatch information.

Disassemble the equipment as described in chapter 4.5 and send it in the original packaging to the address given in the dispatch information.

4.7 Disposal

In accordance to the WEEE-2002/96/EC-Guidelines we take old devices and accessories back for professional disposal. Transport costs are the responsibility of the sender. Use the telefax form on page 135 for disposal request. You'll receive the current dispatch information.

Disassemble the equipment as described in chapter 4.5 and send it in the original packaging to the address given in the dispatch information.

5 Package

5.1 Package supplied

When an amplifier from the S748/772 series is ordered (order numbers ⇒p.133), the following is supplied:

- Servo amplifier S748/772
- Instructions Manual
- Online documentation and setup software DRIVEGUI.EXE on CD-ROM
- Mating connectors X3A, X3B, X4, X9A, X9B

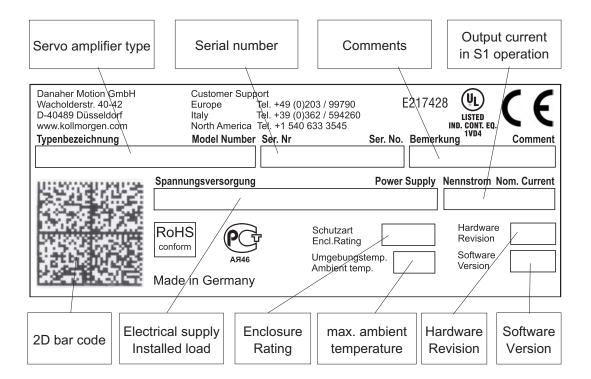

The mating SubD connectors are not part of the package!

<u>Accessories</u>: (must be ordered separately, if required; description see accessories manual)

- Motor cable as a cut-off length
- feedback cable (prefabricated)
 or both feedback connectors separately, with the feedback cable as a cut-off length
- external brake resistor BAR(U)
- communication cable to the PC (⇒ p.82) for setting parameters from a PC
- power cable, control cables, fieldbus cables (as cut-off lengths)

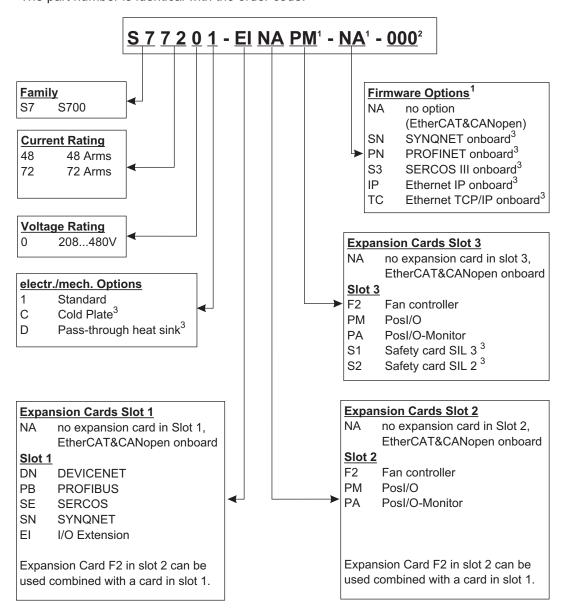

5.2 Nameplate

The nameplate depicted below is attached to the side of the servo amplifier. The information described below is printed in the individual fields.

5.3 Part number scheme

The part number is identical with the order code.

- 1 is void with standard
- 2 is void with standard, additional coding defines customer specific specials.
- 3 in process

Example: S77201-EINAPM-NA-000

- S7 S700 series
- 72 72A rated current
- 0 Supply voltage 208...480V
- 1 no electrical option
- El I/O Extension card in Slot 1
- NA Slot 2 free
- PM Posl/O expansion card in Slot 3
- NA Standard Firmware (EtherCAT & CANopen onboard)
- 000 no customer specific specials

6 Technical description

6.1 The S748/772 family of digital servo amplifiers

Standard version

- Large supply voltage range: 3 x 208V_{-10%} ... 3 x 480V^{+ 10%}
 (with mains voltage below 300V set parameters NONBTB=3 and VBUSBAL=1.)
- CANopen onboard
- EtherCAT onboard
- RS232 and 24V pulse direction interface onboard
- Resolver-, Encoder-, AquadB Encoder-, ComCoder-evaluation onboard
- Position controller onboard
- Safe Stop STO onboard (SIL 2 according to IEC 61800-5-2, PL d or category 3 according to ISO 13849-1)
- 3 frontside slots for expansion cards
- Memory Card slot onboard
- Synchronous servomotors, linear motors and asynchronous motors can be used

Power section

- Directly on grounded 3-phase supply, 208V_{-10%} ... 480V^{+10%}, 50/60 Hz (with mains voltage below 300V set parameters NONBTB=3 and VBUSBAL=1.)
- TN-network or TT-network with grounded neutral point, 42kA max. symmetrical current rating, connection to other supply types only via isolating transformer,⇒p.54
- Overvoltage category III acc. to EN 61800-5-1
- B6 bridge rectifier, integral supply filter and soft-start circuit
- Single-phase supply operation possible (e.g. for setup)
- Fusing (e.g. fusible cutout) to be provided by the user
- Shielding
 All shielding connections are made directly on the amplifier
- Output stage IGBT module with floating current measurement
- Brake circuit with dynamic distribution of the regenerated power between several amplifiers on the same DC bus link circuit.
 External brake resistors if required.
- DC bus link voltage 260...900 V DC, can be connected in parallel.
- Interference suppression filters are integrated for the electrical supply feed and the 24V auxiliary supply voltage (with motor cable ≤ 10m for C2 as per IEC 61800-3, with motor cable < 10m for C3 as per IEC 61800-3).

Integrated safety

- Appropriate insulation/creepage distances and electrical isolation ensure safe electrical separation, as per IEC 61800-5-1, between the power input / motor connections and the signal electronics.
- Soft-start, overvoltage detection, short-circuit protection, phase-failure monitoring.
- Temperature monitoring of the servo amplifier and motor (if our motors and prefabricated cables are used).
- Safe stop (SIL 2 according to IEC 61800-5-2, PL d or category 3 according to ISO 13849-1)

 p. 38.
 - Slot for safety card with more safety functions for the safe drive operation (optional, in preparation), \Rightarrow p. 127

Auxiliary supply voltage 24V DC

- Electrically isolated, internal fusing, from an external 24V DC power supply unit.
- Separate 24V supply input for internal electronic supply
- Separate 24V supply input for motor holding brake supply
- Separate 24V supply input for digital outputs

Operation and parameter setting

- With our user-friendly setup software DRIVEGUI.EXE, for setup via the serial interface of a PC.
- If no PC is available: direct operation by two keys on the servo amplifier and a 3-character LED display.
- Fully programmable via RS232 interface.
- Read/write access to parameter records and firmware via memory card.

Completely digital control

- Digital current controller (space vector, pulse-width modulation, 62.5 μs)
- Adjustable digital speed controller (62.5 μs)
- Integrated position controller, with adaptation possibilities for all applications (250 μs, optionally 125μs)
- Integrated 24V step/direction interface for connecting a servomotor to a stepper controller

Inputs/Outputs

- 2 programmable analog inputs ⇒ p. 77
- 4 programmable digital inputs ⇒ p. 78
- 2 programmable digital inputs/outputs (direction selectable) ⇒ p. 80
- programmable logical combinations of digital signals
- 1 input Enable ⇒ p. 78
- 1 input STO-Enable ⇒ p. 79

Expansions

Slot 1

Expansion cards in slot 1 can be combined with F2 Option in slot 2. More combinations of slot 1 and slot 2 expansion cards are not possible.

- I/O-14/08 expansion card, ⇒ p. 106
- PROFIBUS expansion card, ⇒ p. 109
- SERCOS expansion card, ⇒ p. 110
- DeviceNet expansion card, ⇒ p. 112
- SynqNet expansion card, ⇒ p. 115

Slot 2

- Posl/O expansion card, ⇒ p. 118
- Posl/O-Monitor expansion card, ⇒ p. 118
- F2 Option, controlled fan, later insertion not possible, ⇒ p. 117, can be combined with expansion cards in slot 1.

Slot 3

- Posl/O expansion card, ⇒ p. 125
- Posl/O-Monitor expansion card, ⇒ p. 125
- F2 Option, controlled fan, later insertion not possible, ⇒ p. 126
- Safety expansion card, ⇒ p. 127 (in process)

Several third-party expansion cards (ModBus, LightBus, FIP-IO etc. please contact the manufacturer for further information)

Firmware options

The S748/772 offers (additionally to CANopen and alternatively to EtherCAT) various net protocols via the Ethernet interface X7 (⇒ p. 84) with the appropriate firmware version:

- SN SYNQNET onboard (in process)
- PN PROFINET onboard (in process)
- S3 SERCOS III onboard (in process)
- IP Ethernet IP onboard (in process)
- TC Ethernet TCP/IP onboard (in process)

Macro programming

More information can be found in our Product-WIKI (www.servostar.de).

- 62.5µs / 250µs / 1ms / 4ms / 16ms / IDLE / IRQ
- 128 kByte memory
- IEC 61131 structured text
- 400 easy instructions every 62.5 μs
- CAN objects for multi axis control

6.2 Technical data

NOTICE

For multi-axis systems, observe the specific operating conditions for your system. To reach functional safety with the max. permitted cable length, observe cable requirements ⇒ p. 49.

6.3 LED display

A 3-character LED display indicates the status of the amplifier after switching on the 24V supply (\Rightarrow p.101). When the keys on the front panel are used, the parameter and function numbers are shown, as well as the numbers for any errors and warnings that may occur (\Rightarrow p.102ff).

6.4 Grounding system

AGND	analog inputs, internal analog ground
DGND	24V-IO, digital inputs/outputs, optically isolated.
GND	internal digital ground, encoder Emulation, RS232, CAN
XGND	24V supply, STO Enable
BRGND	24V supply for the motor holding brake

^{*} Kollmorgen North America supplies cables up to 39 meters Kollmorgen Europe supplies cables up to max. length

6.5 Motor holding brake

A 24V holding brake in the motor can be controlled directly by the amplifier.

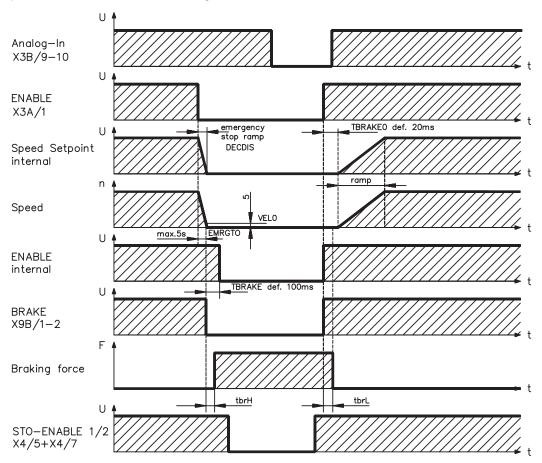

Supply voltage for the holding brake:

A special 24V supply voltage (X9B) is used. Brakes with up to 3A can be controlled directly.

▲ CAUTION

The brake only works with sufficient voltage level (⇒ p.25). Check voltage drop, measure the voltage at brake input and check brake function (brake and no brake). This function does not ensure personnel safety!

The brake function must be enabled through the BRAKE setting (screen page: Motor). In the diagram below you can see the timing and functional relationships between the ENABLE signal, speed setpoint, speed and braking force. All values can be adjusted with parameters, the values in the diagram are default vales.

During the internal ENABLE delay time of 100ms (DECDIS), the speed setpoint of the servo amplifier is internally driven down an adjustable ramp to 0V. The output for the brake is switched on when the speed has reached 5 rpm (VELO), at the latest after 5 s (EMRGTO). The rise (f_{DrH}) and fall (f_{DrL}) times of the holding brake that is built into the motor are different for the various types of motor (see motor manual).

A description of the interface and a wiring diagram for personnel safe braking can be found on page 57.

6.6 Dynamic Braking

During braking with the aid of the motor, energy is fed back into the servo amplifier. This generated energy is dissipated as heat in the brake resistor. The brake resistor is switched in by the brake circuit.

The setup software can be used to adapt the brake circuit (thresholds) according to the electrical supply voltage.

Our customer service can help you with the calculation of the brake power that is necessary for your system. A <u>simple method</u> is described in the "Product Wiki" which is accessible at <u>www.servostar.de</u>. A description of the interface can be found on page 55.

Functional description:

1.- Individual amplifiers, not coupled through the DC bus link circuit (DC+, DC-)

When the energy fed back from the motor has an average or peak power that exceeds the preset level for the brake power rating, then the servo amplifier generates the warning "n02 brake power exceeded" and the brake circuit is switched off.

The next internal check of the DC bus link voltage (after a few milliseconds) detects an overvoltage and the output stage is switched off, with the error message "Overvoltage F02" (⇒ p.102).

The BTB/RTO contact (terminals X3B/14,15) will be opened at the same time (⇒ p.80)

2.- Several servo amplifiers **coupled** through the DC bus link (DC+, DC-)

Using the built-in brake circuit, several amplifiers of the same series can be operated off a common DC bus link (**observe page 56**), without requiring any additional measures.

90% of the **combined power** of all amplifiers is always available for peak and continuous power. The switch-off on overvoltage takes place as described under 1. (above) for the amplifier that has the lowest switch-off threshold (resulting from tolerances).

Technical data of the brake circuits depend on the mains voltage situation.

Technical Data:			Supply	voltage
Rated data	DIM	230 V	400 V	480 V
Switch-on threshold of brake circuit	V	400	720	840
Overvoltage F02	V	455 800 900		
Pulse brake power	kW	16 50 70		70
External brake resistor (RBe) for S748	Ohm	15		
External brake resistor (RBe) for S772	Ohm	10		
Contuous brake power external (RBe)	kW	6		

Suitable external brake resistors can be found in our accessories manual.

6.7 Switch-on and switch-off behavior

This chapter describes the switch-on and switch-off behavior of the S748/772 and the steps required to achieve operational stopping or emergency stop behavior that complies with standards.

The servo amplifier's 24 V supply must remain constant. The ASCII commands ACTFAULT (error response) and STOPMODE (ENABLE signal response) dictate how the drive will behave.

ACTFAULT / Behavior (see also ASCII reference in the online help of the setup soft-		
STOPMODE	ware)	
0	Motor coasts to a standstill in an uncontrolled manner	
1 (default)	Motor is braked in a controlled manner	

Behavior during a power failure

The servo amplifiers use an integrated circuit to detect if one or more input phases (power supply feed) fail. The behavior of the servo amplifier is set using the setup software: Under "Response to Loss of Input Phase" (PMODE) on the Basic Setup screen, select:

- Warning if the higher-level control system is to bring the drive to a standstill: Warning n05 is output if an input phase is missing, and the motor current is limited to 4 A. The servo amplifier is not disabled. The higher-level control system can now selectively end the current cycle or start bringing the drive to a standstill. Therefore, the error message "MAINS BTB, F16" is output on a digital output of the servo amplifier and evaluated by the control system, for instance.
- Error message if the servo amplifier is to bring the drive to a standstill: Error message F19 is output if an input phase is missing. The servo amplifier is disabled and the BTB contact opens. Where the factory setting is unchanged (ACTFAULT=1), the motor is braked using the set "EMERGENCY STOP RAMP".

Behavior when undervoltage threshold is reached

If the undervoltage threshold is undershot in the DC bus link (the threshold value depends on the type of servo amplifier), the error message "UNDERVOLTAGE, F05" is displayed. The drive response depends on the ACTFAULT/STOPMODE setting.

Behavior with enabled "holding brake" function

Servo amplifiers with an enabled holding brake function have a special procedure for switching off the output stage (⇒ p. 28). Removing the ENABLE signal triggers electrical braking.

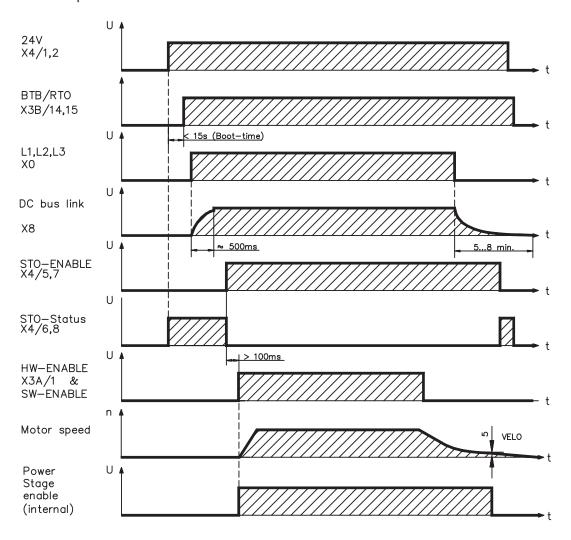

As with all electronic circuits, the general rule applies that there is a possibility of the internal "holding brake" module failing. Bringing a motor to a standstill using a holding brake in a way that is personnel safe also requires an electromechanical "make" contact for the holding equipment and a suppressor device for the brake.

Behavior of the restart lock STO

With the personnel safe restart lock STO, the drive can be secured on standstill using its internal electronics so that even when power is being supplied, the drive shaft is protected against unintentional restart. The chapter "Personnel safe restart lock STO" describes how to use the restart lock STO. See page 38 onwards.

6.7.1 Behavior in standard operation

The behavior of the servo amplifier always depends on the current setting of a number of different parameters (e.g., ACTFAULT, VBUSMIN, VELO, STOPMODE, etc. see online help). The diagram below illustrates the correct functional sequence for switching the servo amplifier on and off.

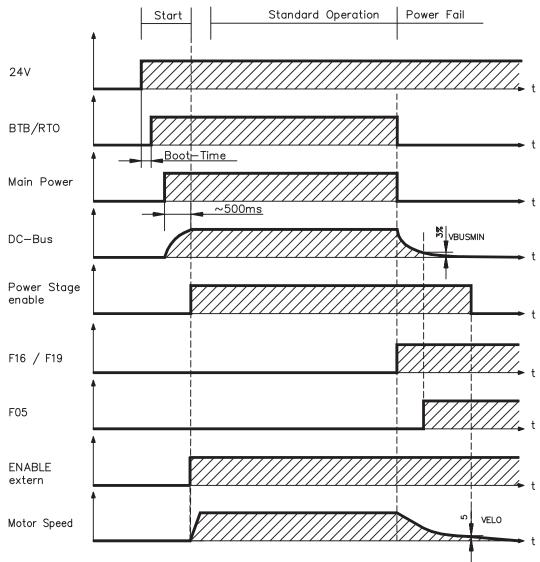

Devices which are equipped with a selected "Brake" function use a special sequence for switching off the output stage (\Rightarrow p.28).

The built-in restart lock STO can be used to switch off the drive, so that personnel safety is ensured at the drive shaft (\Rightarrow p. 38).

6.7.2 Behavior in the event of an error (with standard setting)

The behavior of the servo amplifier always depends on the current setting of a number of different parameters (e.g., ACTFAULT, VBUSMIN, VELO, STOPMODE, etc.; see online help). The diagram shows the startup procedure and the procedure that the internal control system follows in the event of one or more electrical supply phases failing, assuming that the standard parameter settings apply.

(F16/F19 = error messages Mains BTB /input phase, F05 = error message Undervoltage)

Even if there is no intervention from an external control system (in the example, the ENABLE signal remains active), the motor is immediately braked using the emergency stop ramp if an input phase error is detected and assuming that no changes have been made to the factory setting (ACTFAULT=1).

6.8 Stop- / Emergency Stop- Function to IEC 60204

With the personnel safe, certified restart lock STO (see page 38 onwards) the drive can be secured on standstill (torque-free) using its internal electronics so that even when power is being supplied, the drive shaft is protected against unintentional restart. This function is going to be certified and cannot be used until the end of the certification process.

The integrated "Safety" expansion card provides safe drive functions in accordance with IEC 61800-5-2 (see page 127 ff)

6.8.1 Stop: Standards

The Stop function is used to shut down the machine in normal operation. The Stop functions are defined by IEC 60204.

Category 0: Shut-down by immediate switching-off of the energy supply to the

drive machinery (i.e. an uncontrolled shut-down);

Category 1: A controlled shut-down, whereby the energy supply to the drive

machinery is maintained to perform the shut-down, and the energy supply is only interrupted when the shut-down has been completed;

Category 2: A controlled shut-down, whereby the energy supply to the drive

machinery is maintained.

The parameters "STOPMODE" and "ACTFAULT" must be set to 1 in order to implement the stop categories. If necessary, change the parameters via the terminal screen of the setup software and store the data in the EEPROM.

The Stop Category must be determined by a risk evaluation of the machine. In addition, suitable means must be provided to guarantee a reliable shut-down.

Category 0 and Category 1 Stops must be operable independently of the operating mode, whereby a Category 0 Stop must have priority. Stop functions must be implemented by **disconnection** of the appropriate circuitry, and have priority over assigned start functions.

If necessary, provision must be made for the connection of protective devices and lock-outs. If applicable, the Stop function must signal its status to the control logic. A reset of the Stop function must not create a hazardous situation.

6.8.2 Emergency Stop: Standards

The emergency Stop function is used for the **fastest possible shut-down** of the machine in a dangerous situation. The Emergency Stop function can be triggered by the actions of a single person. It must be fully functional and available at all times. The user must not have to work out how to operate this mechanism.

The Emergency Stop function is defined by IEC 60204.

In addition to the requirements for Stop, the emergency Stop must fulfil the following requirements:

- emergency stop must have priority over all other functions and controls in all operating situations;
- the energy supply to any drive machinery that could cause dangerous situations
 must be switched off as fast as possible, without causing any further hazards (e.g. by
 using mechanical latching devices that do not require an external supply of energy,
 by counter-current braking in Stop Category 1);
- the reset must not initiate a restart.

If necessary, provision must be made for the additional connection of emergency stop devices (see IEC 60204, "Requirements for emergency stop devices"). The Emergency Stop must be effective as a stop of either Category 0 or Category 1.

The Emergency Stop Category must be determined by a risk evaluation of the machine.

Category 0

Only hard-wired, electromechanical components may be used for the Category 0 Emergency Stop function. It must not be triggered using switching logic (hardware or software), by transferring commands via a communication network, or via a data link. The drive must be shut down using an electromechanical circuit. If the connected servo motor has an integrated brake, this must always be controlled by an electromechanical circuit as well.

Category 1

With the Category 1 Emergency Stop function, there must be absolute certainty in terms of the power supply for the machine drives being switched off (i.e., secured) using electromechanical components. Additional Emergency Stop equipment may be connected. Bringing the motor to a standstill by interrupting the mains supply and using controlled electronic braking. The 24 V supply for the servo amplifier must remain constant. The issue of which circuit should be used is highly dependent on the requirements of the application at hand.

In most servo motors a brake has only the function of a holding brake. To ensure an emergency stop function, the braking torque that is required must be checked. If the holding brake fulfills the dynamic requirements, it must be taken into acount that this application will cause increased wear.

The parameters "STOPMODE" and "ACTFAULT" must be set to 1 in order to implement the stop categories. If necessary, change the parameters via the terminal screen of the setup software and store the data in the EEPROM.

6.8.3 Implementation of the Stop Category 0

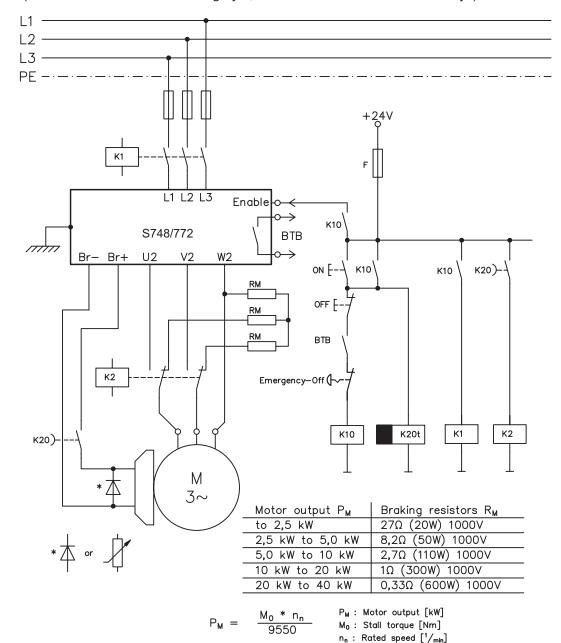

Bringing the motor to a standstill by immediately switching off the amplifier power supply (STOPMODE & ACTFAULT parameters set to 1). The switching sequence is precisely determined by this circuit in order to avoid undesirable fault messages and servo amplifier failures.

It is not possible to achieve a Category 0 shut-down with the servo amplifier alone, since hard-wired electromechanical components are compulsory for this type of disconnection. A brake that is built into the motor must have an additional electromechanical control circuit, as well as the control through the S748/772, in order to meet Category 0.

Usually a brake in a servo motor only has the function of a holding brake. To ensure an emergency stop function, the braking torque that is required must be checked. If the holding brake fulfills the dynamic requirements, it must be taken into acount that this application will cause increased wear.

Circuit suggestion

(with EMERGENCY STOP Category 0, control function with contactor relays)

6.8.4 Implementation of the Stop Category 1

Bringing the motor to a standstill by interrupting the mains supply and using controlled electronic braking (STOPMODE & ACTFAULT parameters set to 1). The 24 V supply for the S748/772 must remain constant.

The drive is braked in a controlled manner during the stopping (disabling) procedure. If the speed VEL0 (see sequence diagram in chapter 6.5) is undershot, the holding brake is applied and the output stage is disabled.

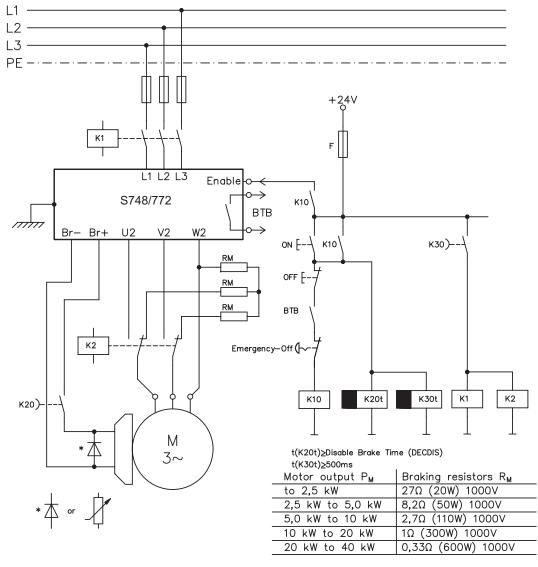

As soon as two separate time periods (set at the time relay) have elapsed, the mains supply and the holding brake are electrically isolated.

NOTICE

Should an internal S748/772 fault occur, the motor is forced to a standstill once K20 drops out. Make sure, that the machinery cannot be damaged by forced braking. Forced braking with the built-in motor holding brake can damage the brake.

Circuit suggestion

(with EMERGENCY STOP Category 1, control function with contactor relays)

 $P_{M} = \frac{M_{0} * n_{n}}{9550}$ $P_{M} : Motor output [kW]$ $M_{0} : Stall torque [Nm]$ $n_{n} : Rated speed [1/mln]$

6.8.5 Implementation of the Stop Category 2

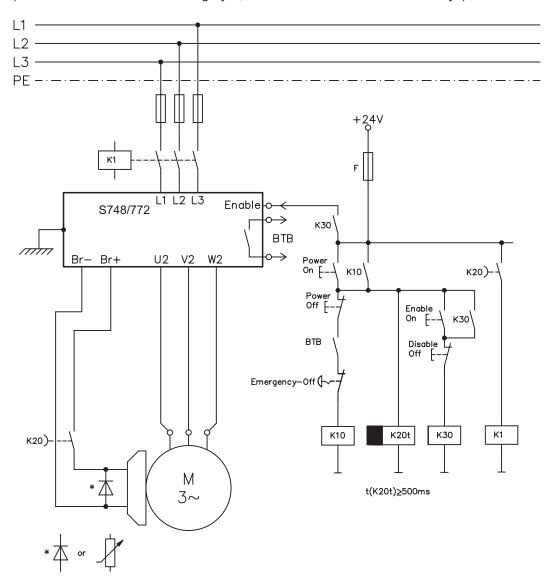

The machine receives an operational stop (disable) command and brakes the drive using the set braking ramp (STOPMODE & ACTFAULT parameters set to 1).

The drive is braked in a controlled manner during the stopping (disabling) procedure. If the speed VEL0 (see sequence diagram in chapter 6.5) is undershot, the holding brake is applied and the output stage is disabled. In this case, there is no interruption of the electrical supply.

If the electrical supply is switched off, not only will the controlled braking procedure be performed, but the mains supply and the holding brake will also be electrically isolated following a time period set at the time relay.

Circuit suggestion

(with EMERGENCY STOP Category 1, control function with contactor relays)

6.9 Personnel safe restart lock STO

A frequently required application task is the protection of personnel against the restarting of drives. This can be achieved by an electronic inhibit or with mechanical elements (positively driven relay contacts).

When positively driven relay contacts where used, either the net contactor in the mains supply circuit switched off or the motor was disconnected from the servo amplifier by an additional contactor.

The disadvantages of this method are:

- the DC bus link has to be charged up again at restart
- wear on the contacts of the contactors, caused by switching under load
- extensive wiring required, with additional switching components

The restart lock STO avoids these disadvantages.

The circuit concept is going to be examined by a public association. We cannot we cannot ensure the functional and personnel safety of the STO function until the certification process is ended.

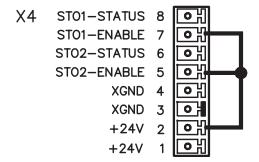

Advantages of the restart lock STO:

- the DC bus link remains charged up, since the mains supply line remains active
- only low voltages are switched, so there is no contact wear
- very little wiring is required

6.9.1 Technical data and pinning

Input voltage Channel 1 and 2	20V30V
Input current Channel 1 and 2	33mA – 45mA (leff)
Peak current Channel 1 and 2	220mA (Is)

Disable the STO function until the circuit is certified:

6.10 Shock-hazard protection

6.10.1 Leakage current

Leakage current via the PE conductor results from the combination of equipment and cable leakage currents. The leakage current frequency pattern comprises a number of frequencies, whereby the residual-current circuit breakers definitively evaluate the 50Hz current. For this reason, the leakage current cannot be measured using a conventional multimeter.

As a rule of thumb, the following assumption can be made for leakage current on our low-capacity cables at a mains voltage of 400 V, depending on the clock frequency of the output stage:

 I_{leak} = n x 20mA + L x 1mA/m at 8kHz clock frequency at the output stage I_{leak} = n x 20mA + L x 2mA/m at a 16kHz clock frequency at the output stage (where lleak=leakage current, n=number of amplifiers, L=length of motor cable)

At other mains voltage ratings, the leakage current varies in proportion to the voltage.

Example: 2 x servo amplifiers + a 25m motor cable at a clock frequency of 8kHz:

 $2 \times 20mA + 25m \times 1mA/m = 65mA$ leakage current.

Since the leakage current to PE is more than 3.5 mA, in compliance with IEC 61800-5-1 the PE connection must either be doubled or a connecting cable with a cross-section >10mm² must be used. Use the PE terminals and the PE bolt in order to fulfil this requirement.

The following measures can be used to minimise leakage currents.

- Reduce the length of the engine cable
- Use low-capacity cables (see p.49)
- Remove external EMC filters (radio-interference suppressors are integrated)

6.10.2 Residual current protective device (RCD)

In conformity with IEC 60364-4-41 – Regulations for installation and IEC 60204 – Electrical equipment of machinery, residual current protective devices (called RCD below) can be used provided the requisite regulations are complied with.

The S748/772 is a 3-phase system with a B6 bridge. Therefore, **RCDs which are sensitive to all currents** must be used in order to detect any D.C. fault current. Refer to chapter 6.10.1 for the rule of thumb for determining the leakage current.

Rated residual currents in the RCD

10 -30 mA		Protection against "indirect contact" (personal fire protection) for stationary
	10 -30 MA	and mobile equipment, as well as for "direct contact".
	50 -300 mA	Protection against "indirect contact" (personal fire protection) for stationary
	50 -300 MA	equipment

Recommendation: In order to protect against direct contact (with motor cables shorter than 5 m) we recommend that each servo amplifier be protected individually using a 30mA RCD which is sensitive to all currents.

If you use a selective RCD, the more intelligent evaluation process will prevent spurious tripping of the RCD.

6.10.3 Isolating transformers

When protection against indirect contact is absolutely essential despite a higher leakage current, or when an alternative form of shock-hazard protection is sought, the S748/772 can also be operated via an isolating transformer (schematic connection see p.54).

A ground-leakage monitor can be used to monitor for short circuits.

Be advised to keep the length of wiring between the transformer and the servo amplifier as short as possible.

7 Mechanical Installation

7.1 Safety Instructions

▲ CAUTION

There is a danger of electrical shock by high EMC level which could result in injury, if the servo amplifier (or the motor) isn't properly EMC-grounded. Do not use painted (i.e. non-conductive) mounting plates.

NOTICE

Protect the servo amplifier from impermissible stresses. In particular, do not let any components become bent or any insulation distances altered during transport and handling. Avoid contact with electronic components and contacts.

NOTICE

The servo amplifier will switch-off itself in case of overheating. Ensure that there is an adequate flow of cool, filtered air into the bottom of the control cabinet, or use a heat exchanger. Please refer to page 26.

NOTICE

Don't mount devices, which produce magnetic fields, directly beside the servo amplifier. Strong magnetic fields could directly affect internal components. Install devices which produce magnetic field with distance to the servo amplifiers and/or shield the magnetic fields.

7.2 Guide to mechanical installation

The following notes should help you to carry out the mechanical installation.

Site	In a closed control cabinet. Please refer to page 26. The site must be free from conductive or corrosive materials. For the mounting position in the cabinet p.43.
Ventilation	Check that the ventilation of the servo amplifier is unimpeded, and keep within the permitted ambient temperature ⇒ p.26. Keep the required space clear above and below the servo amplifier ⇒ p.43.
A	Assemble the servo amplifier and power supply close together, on the

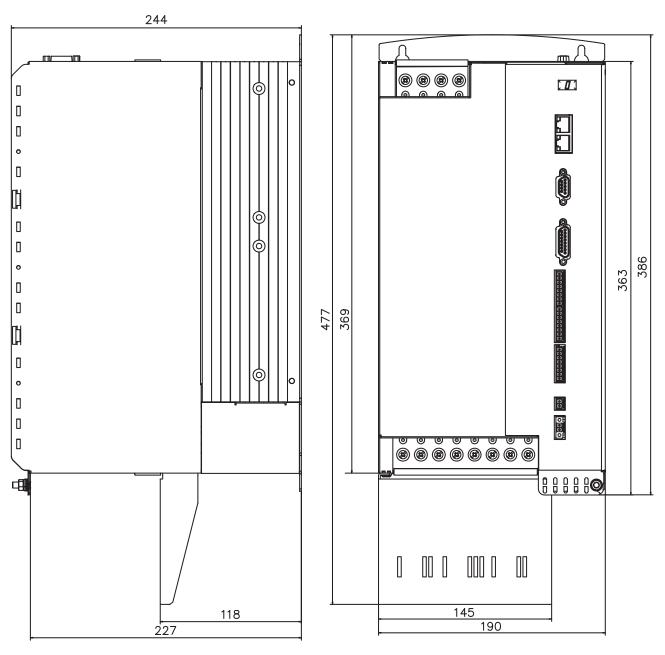

conductive, grounded mounting plate in the cabinet.

Grounding Shielding

Assembly

For EMC-compliant shielding and grounding ⇒ p.53. Ground the mounting plate, motor housing and CNC-GND of the control system. Notes on connection techniques ⇒ p.48.

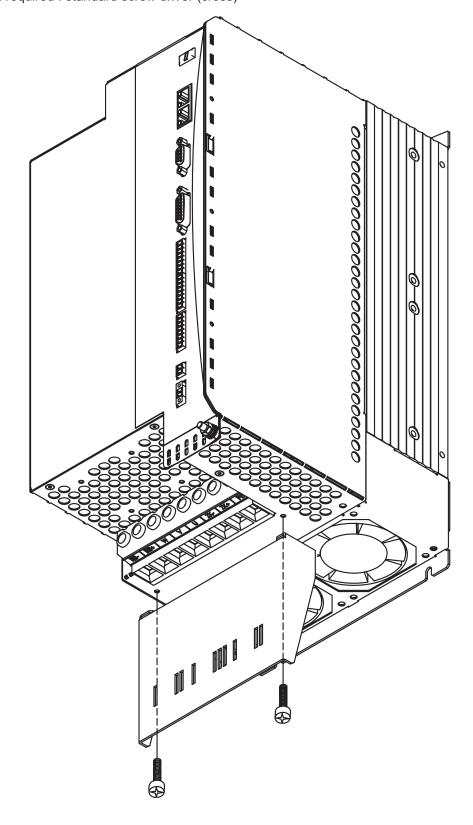

7.3 Dimensions

7.4 Assembly

7.4.1 Mounting the shroud

Material: unscrew existing screws and re-use them Tool required : standard screw driver (cross)

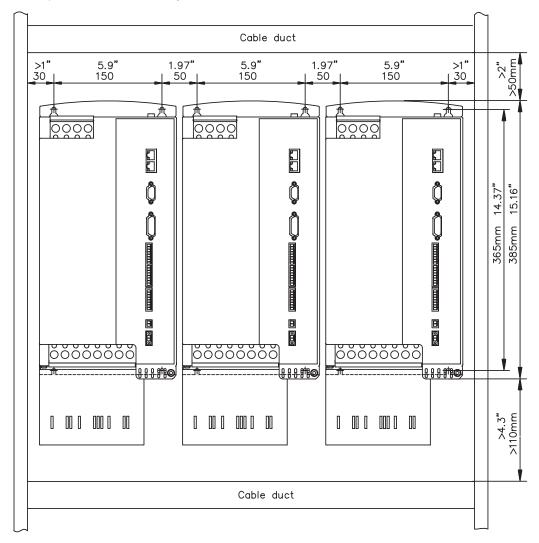

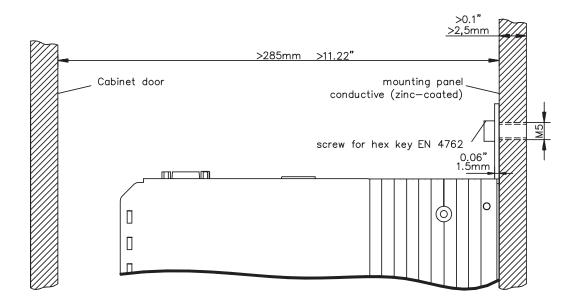

44

7.4.2 Backplane mounting

Material: four M5 hexagon socket screws to ISO 4762

Tool required: 4 mm Allen key

8 Electrical installation

8.1 Safety Instructions

▲ DANGER

Never undo any electrical connections to the servo amplifier while it is live. There is a danger of electrical arcing with damage to contacts and serious personal injury. Wait at least ten minutes after disconnecting the servo amplifier from the main supply power before touching potentially live sections of the equipment (e.g. contacts) or undoing any connections.

Capacitors can still have dangerous voltages present up to ten minutes after switching off the supply power. To be sure, measure the voltage in the DC Bus link and wait until it has fallen below 40V.

Control and power connections can still be live, even if the motor is not rotating.

NOTICE

Wrong mains voltage, unsuitable motor or wrong wiring will damage the amplifier. Check the combination of servo amplifier and motor. Compare the rated voltage and current of the units. Implement the wiring according to the connection diagram on page 47.

Make sure that the maximum permissible rated voltage at the terminals L1, L2, L3 or +DC, –DC is not exceeded by more than 10% even in the most unfavorable circumstances (see IEC 60204-1).

NOTICE

Excessively high external fusing will endanger cables and devices. The fusing of the AC supply input and 24V supply must be installed by the user, best values are given on p.26. Hints for use of Residual-current circuit breakers (FI) ⇒ p.39.

NOTICE

Correct wiring is the basis for reliable functioning of the servo system. Route power and control cables separately. We recommend a distance of at least 200mm. This improves the interference immunity. If a motor power cable is used that includes cores for brake control, the brake control cores must be separately shielded. Ground the shielding at both ends. Ground all shielding with large areas (low impedance), with metalized connector housings or shield connection clamps wherever possible. Notes on connection techniques can be found on page 48.

NOTICE

Feedback lines may not be extended, since thereby the shielding would be interrupted and the signal processing could be disturbed. Lines between amplifiers and external brake resistor must be shielded. Install all cables with an adequate cross-section, as per IEC 60204 (⇒ p.27) and use the requested cable material (⇒ p. 49) to reach max. cable length.

NOTICE

The servo amplifier's status must be monitored by the PLC to acknowledge critical situations. Wire the BTB/RTO contact in series into the emergency stop circuit of the installation. The emergency stop circuit must operate the supply contactor.

It is permissible to use the setup software to alter the settings of the servo amplifier. Any other alterations will invalidate the warranty.

8.2 Guide to electrical installation

The following notes should help you to carry out the electrical installation.

Cable selection Select cables in accordance with IEC 60204 ⇒ p.27.

Grounding Shielding

For EMC-compliant shielding and grounding ⇒ p.53. Ground the mounting plate, motor housing and CNC-GND of the control system. Notes on connection techniques ⇒ p.48.

Wiring

Route power leads and control cables separately. Wire the BTB/RTO contact in series into the emergency stop circuit of the system.

- Connect the digital control inputs and outputs.
- Connect up AGND (also if fieldbuses are used).
- Connect the analog input source, if required.
- Connect the feedback device.
- Connect the expansion card (see corresponding notes from page 105).
- Connect the motor cable
 - Connect shielding at both ends.
- Connect motor-holding brake, connect shielding at both ends.
- Connect external brake resistor (with fusing)
- Connect the auxiliary supply (maximum permissible voltage values ⇒ p.26).
- Connect the main electrical supply (maximum permissible voltage values ⇒ p.26), hints for use of Residual-current circuit breakers (FI) ⇒ p.39
- Connect the PC (⇒ p.82).

Final check

 Final check of the implementation of the wiring against the wiring diagrams that have been used.

8.3 Wiring

The installation procedure is described as an example. A different procedure may be appropriate or necessary, depending on the application of the equipments. We provide further know-how through **training courses** (on request).

8.3.1 Safety Instructions

▲ DANGER

There is a danger of electrical arcing with serious personal injury. Only install and wire up the equipment when it is not live, i.e. when neither the electrical supply nor the 24 V auxiliary voltage nor the supply voltages of any other connected equipment is switched on.

Take care that the cabinet is safely disconnected (with a lock-out, warning signs etc.). The individual voltages will be switched on for the first time during setup.

A CAUTION

Only professional staff who are qualified in electrical engineering are allowed to install the servo amplifier.

8.3.2 Important Notes

The ground symbol r/r/r, which you will find in all the wiring diagrams, indicates that you must take care to provide an electrically conductive connection with the largest feasible surface area between the unit indicated and the mounting plate in the control cabinet. This connection is for the effective grounding of HF interference, and must not be confused with the PE-symbol $\frac{1}{r}$ (PE = protective earth, safety measure as per IEC 60204).

8.3.3 Shielding connection to the front panel

Remove the outside shroud of the cable and the shielding braid on the desired core length. Secure the cores with a cable tie.

Remove the outside shroud of the line on a length from for instance 30mm without damaging the shielding braid.

Strip all wires and fit wire end ferrules.

Use cable ties to attach the cable to the side (1) or bottom (2) shroud of the servo amplifier, securing the braided shield of the cable to the shroud of the servo amplifier with a cable tie.

Alternatively you can use shield connection terminal clamps (see accessories manual). These hook into the bottom shroud and ensure optimum contact between the shield and the shroud.

Wire the plug-in terminal blocks as shown in the connection diagram.

The motor cable shield is connected via a shield connection terminal clamp to the big shroud (3).

8.3.4 Technical data for connecting cables

For further information on the chemical, mechanical and electrical characteristics of the cables please refer to the accessories manual or contact our customer service.

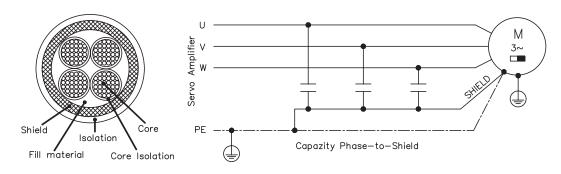

Observe the rules in the section "Conductor cross-sections" on page 27. To reach the max. permitted cable length, you must use cable material that matches the capacitance requirements listed below.

Capacitance (phase to shield)

Motor cable less than 150 pF/m Resolver/Encoder cable less than 120 pF/m

Example: Motor cable

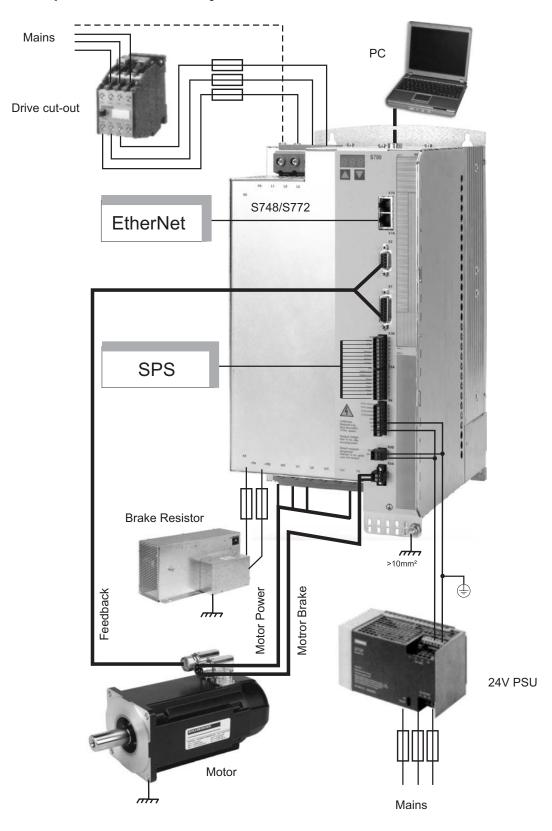

Technical data

For a detailed description of Kollmorgen cable types and how to assemble them, please refer to the accessories manual.

With motor cables longer than 25m the use of a motor choke may be necessary depending on the system. Please contact our customer support.

8.4 Components of a servo system

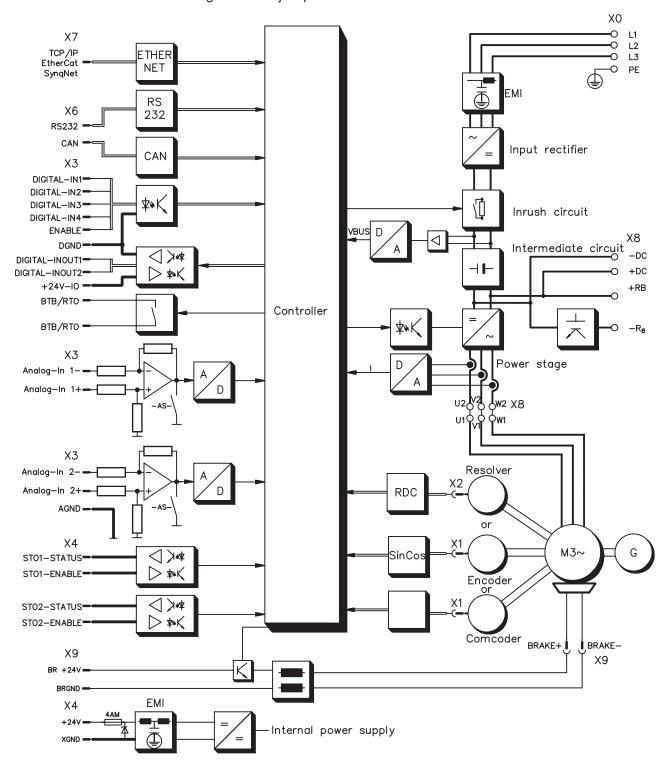

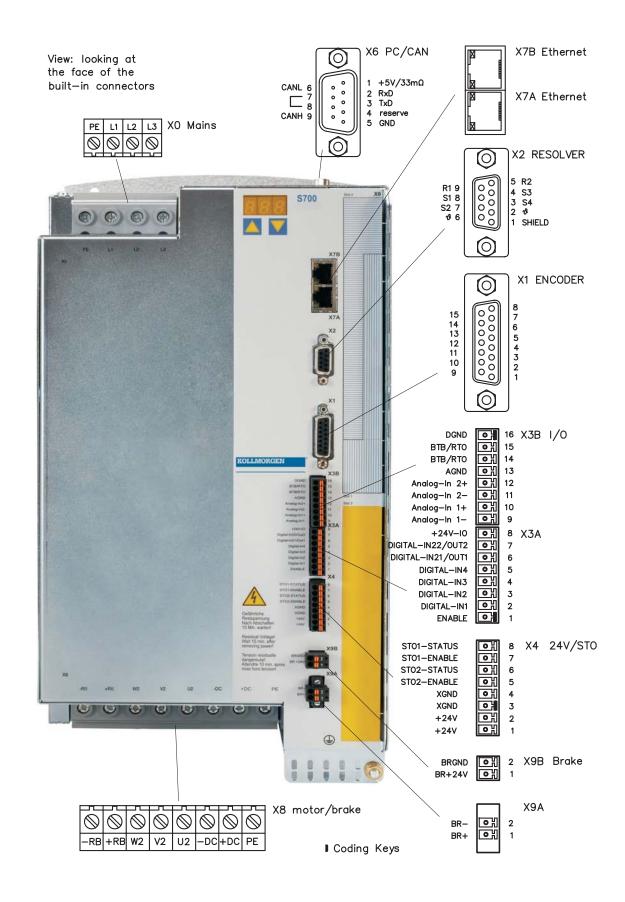

Cables drawn bold are shielded. The required accessories are described in our accessories manual.

8.5 Block diagram

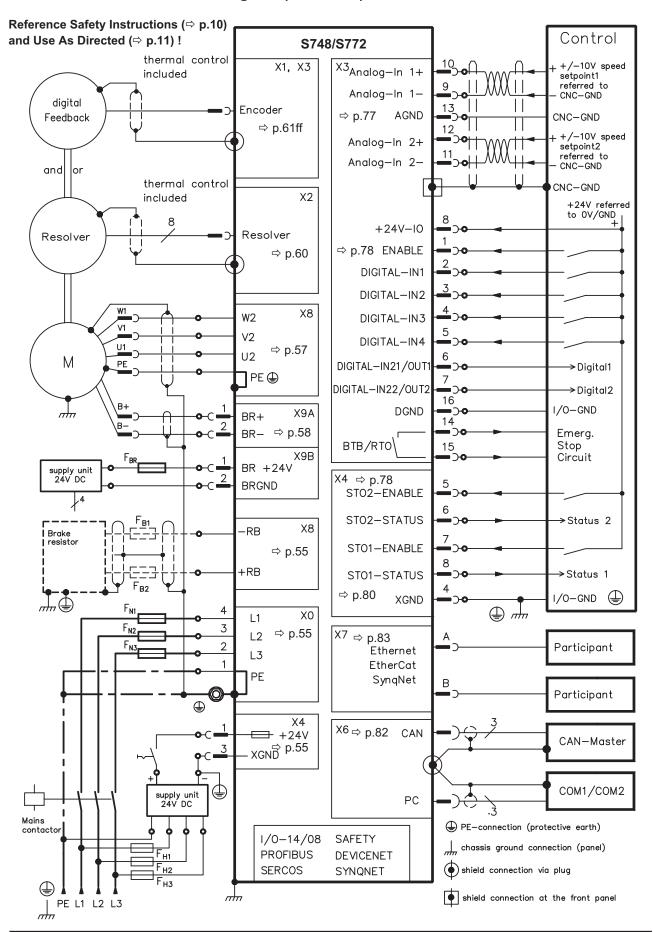

The block diagram below just provides an overview.

8.6 Connector assignments

8.7 Connection Diagram (Overview)

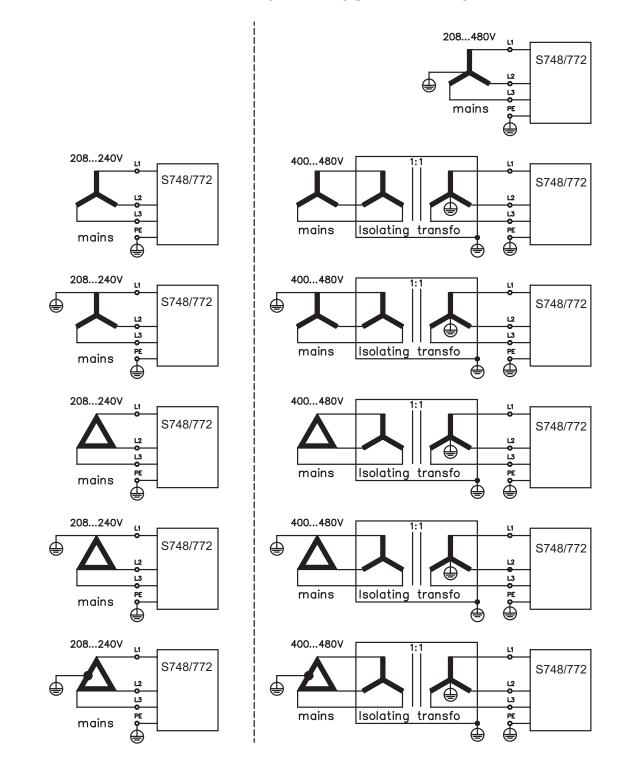

8.8 Electrical supply

8.8.1 Connection to various mains supply networks

This page illustrates all the possible connection variations for different electrical supply networks.

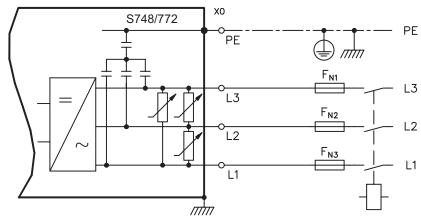

A WARNING

There is a danger of electrical shock with serious personal injury if the servo amplifier isn't properly grounded. An isolating transformer is always required for 400 ... 480V networks that are asymmetrically grounded or not grounded.

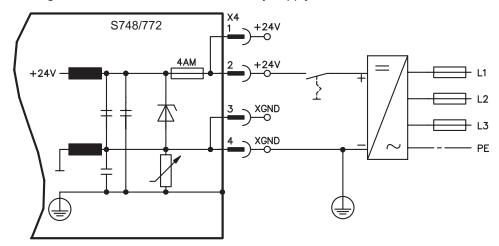

8.8.2 Mains supply connection (X0)

- Directly to 3-phase supply network, filter is integrated, supply networks ⇒ p.54 (with mains voltage below 300V set parameters NONBTB=3 and VBUSBAL=1.)
- Fusing (e.g. fusible cut-outs) to be provided by the user ⇒ p.26
- Screw driver for plus-minus-screws (Combiprofile Slotted/Pozidriv) size 2

8.8.3 24V auxiliary supply (X4)

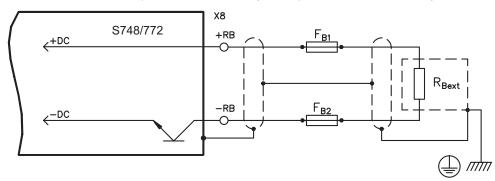

- External 24V DC power supply, electrically isolated, e.g. via an isolating transformer
- Required current rating ⇒ p.24
- Integrated EMC filter for the 24V auxiliary supply

8.9 External brake resistor (X8)

An external brake resistor can be connected to X8 (-RB, +RB). If you want to link the DC bus with neighboured S748/772 servo amplifiers, see connection example on page 56, Chapter "DC Bus link".

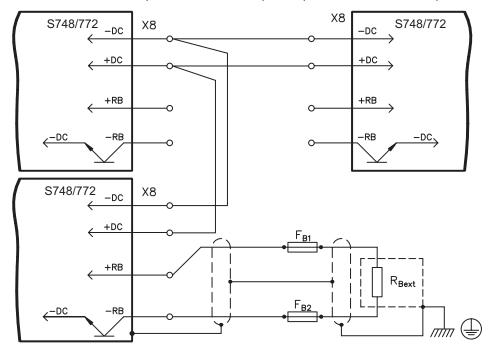

Screw driver for plus-minus-screws (Combiprofile Slotted/Pozidriv) size 2

8.10 DC bus link (X8)

Terminals X8/-DC and X8/+DC. Can be connected in parallel, whereby the brake power is divided between all the amplifiers that are connected to the same DC bus link circuit.

Screw driver for plus-minus-screws (Combiprofile Slotted/Pozidriv) size 2

In case of mains supply from the same mains (identical mains supply voltage) three servo amplifiers S748/772 may be connected by the DC bus link.

NOTICE

The servo amplifiers can be destroyed, if DC bus link voltages are different. Only servo amplifiers with mains supply from the same mains (identical mains supply voltage) may be connected by the DC bus link.

The sum of the rated currents for all of the servo amplifiers connected in parallel to an S748/772 must not exceed 96 Arms (140 Apeak).

Use unshielded single cores (cross section see p. 27) with a max. length of 500mm. Use shielded cables for longer lengths.

Fusing information are explained in detail in the "Product Wiki", available at www.servostar.de, on the WIKI page "DC Bus link in parallel".

8.11 Motor connection (X8)

8.11.1 Motor Power Connection

Together with the motor supply cable and motor winding, the power output of the servo amplifier forms an oscillating circuit. Characteristics such as cable capacity, cable length, motor inductance, frequency and voltage rise speed (see Technical Data, p. 24) determine the maximum voltage in the system.

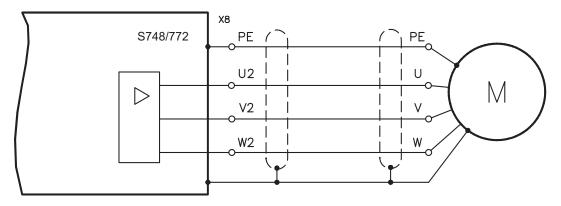

Screw driver for plus-minus-screws (Combiprofile Slotted/Pozidriv) size 2

NOTICE

The dynamic voltage rise can lead to a reduction in the motor's operating life and, on unsuitable motors, to flashovers in the motor winding.

- Only install motors with insulation class F (acc. to IEC 60085) or above
- Only install cables that meet the requirements on p.27 and p.49

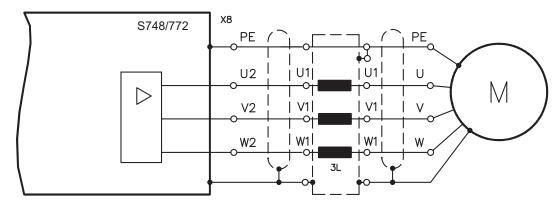

Standard applications up to 25m cable length

Application with cable length >25m and special conditions

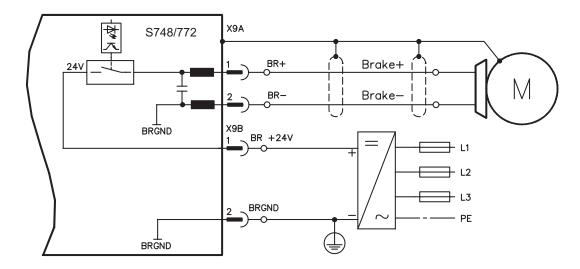

NOTICE

With long motor cables overvoltage may endanger the motor winding. For cable lengths above 25m a motor choke may be wired into the motor cable, close to the amplifier. Contact our customer support.

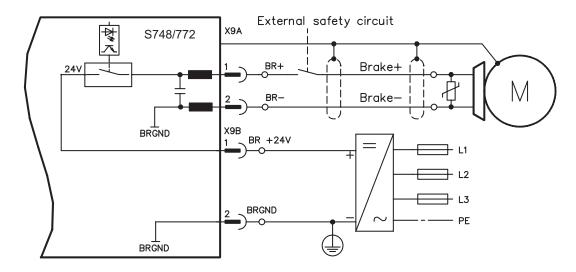

8.11.2 Motor holding brake

The motor holding brake can be controller by the servo amplifier. An external 24V supply voltage delivers the required electrical power for the connected brake. Observe the requirements to the supply voltage listed on page 25.

Operation of the brake in a manner that provides personnel safety requires an additional "make" contact in the brake circuit, and a suppressor device, such as a varistor, for the brake circuit.

Recommended circuit:

8.12 Feedback

Every closed servo system will normally require at least one feedback device for sending actual values from the motor to the servo drive. Depending on the type of feedback device used, information will be fed back to the servo amplifier using digital or analog means. Up to three feedback devices can be used at the same time. S748/772 supports the most common types of feedbacks whose functions must be assigned with the parameters

FBTYPE (screen page FEEDBACK), primary Feedback **EXTPOS** (screen page POSITION CONTROLLER), secondary Feedback

GEARMODE (screen page ELECTRONIC GEARING), secondary Feedback (⇒ p.68) in the setup software. Scaling and other settings must always be made here.

Configuration	Location	ASCII Parameter	Commu- tation	Speed control	Position- control	electr. gearing
One Feedback	motor	FBTYPE	Х	Χ	Х	
Two Feedbacks	motor	FBTYPE	Х	Χ		
(Position externally)	externally	EXTPOS			Х	
Two Feedbacks	motor	FBTYPE	Х	Χ	Х	
(Gearing externally)	externally	GEARMODE				Х
Three Feedbacks	motor	FBTYPE	Х	Χ		
(Position and Gea-	externally	EXTPOS			Х	
ring externally)	externally	GEARMODE				X

For a detailed description of the ASCII parameters, please refer to the online help of the setup software.

The table below provides an overview of the supported feedback types, their corresponding parameters and a reference to the relevant connection diagram in each case.

			primary	secondary		
Feedback type	Connec- tor	Wiring diagram	FBTYPE	EXTPOS		
Resolver	X2	⇒ p.60	0	-		
SinCos Encoder BISS	X1	⇒ p.61	20, 22, 23, 24	11

with expansion card "Posl/O" or "Posl/O-Monitor"						
ROD (AquadB) 5V with zero	X5	⇒ p.119	13, 19	3		
ROD (AquadB) 5V with zero + Hall	X5/X1	⇒ p.120	18	-		
SSI	X5	⇒ p.121	9	5		
Step/Direction 5V	X5	⇒ p.122	-	4		

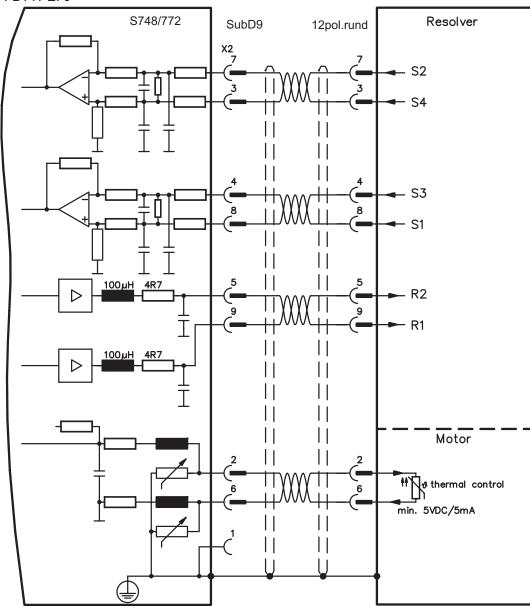

^{*} ROD is an abbreviation for "incremental encoder".

8.12.1 Resolver (X2)

Connection of a Resolver (2 to 36-poles) as a feedback system (primary, \Rightarrow p.59). The thermal control in the motor is connected via the resolver cable to X2 and evaluated there.

If cable lengths of more than 100m are planned, please consult our customer service.

FBTYPE: 0

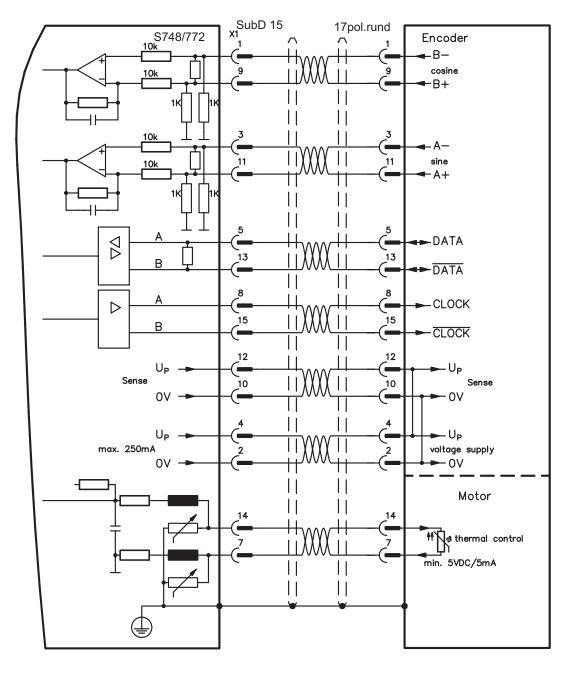

8.12.2 Sine Encoder with BISS (X1)

Wiring of a single-turn or multi-turn sine-cosine encoder with BISS interface as a feed-back system (primary and secondary, \Rightarrow p.59).

The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable. If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit (sin, cos): 350 kHz

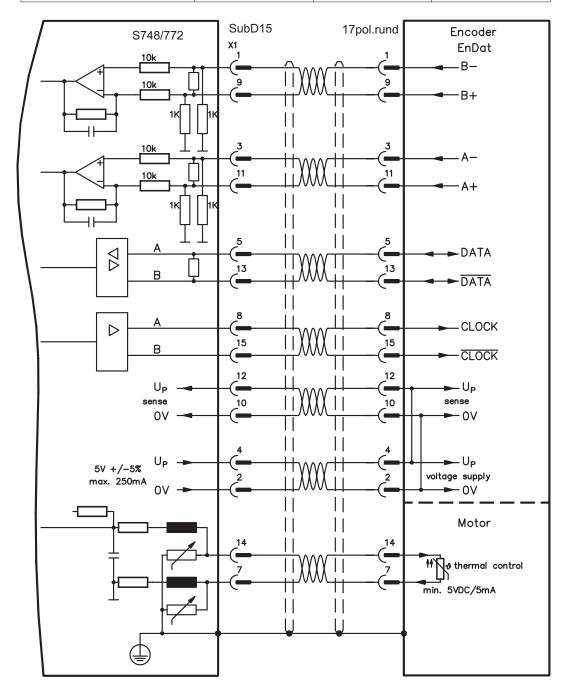

Туре	FBTYPE	EXTPOS	GEARMODE	Up
5V digital	20	11	11	5V +/-5%
12V digital	22	11	11	7,511V
5V analog	23	11	-	5V +/-5%
12V analog	24	11	-	7,511V

8.12.3 Sine Encoder with EnDat 2.1 (X1)

Wiring of a single-turn or multi-turn sine-cosine encoder with EnDat 2.1 interface as a feedback system (primary and secondary, ⇒ p.59). Preferred types are the optical encoders ECN1313 / EQN1325 and the inductive encoders ECI 1118/1319 or EQI 1130/1331. The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable. If cable lengths of more than 50m are planned, please consult our customer service. Frequency limit (sin, cos): 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
ENDAT 2.1	4	8	8
ENDAT 2.1 + Wake&Shake	21	8	8

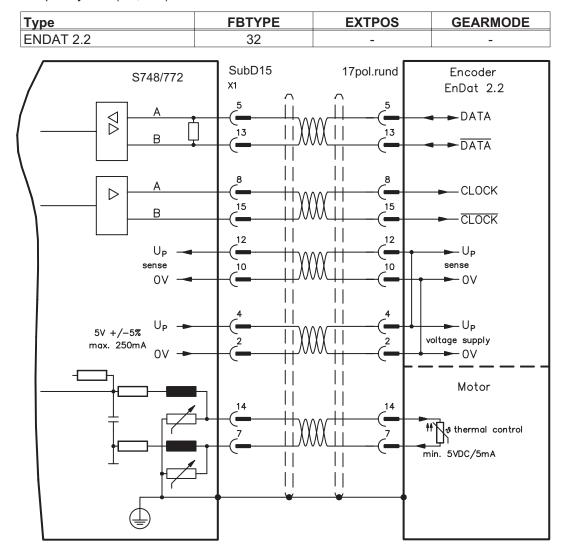

8.12.4 Sine Encoder with EnDat 2.2 (X1)

Wiring of a single-turn or multi-turn sine-cosine encoder with EnDat 2.2 interface as a feedback system (primary and secondary, \Rightarrow p.59). The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable.

If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit (sin, cos): 350 kHz

8.12.5 Sine Encoder with HIPERFACE (X1)

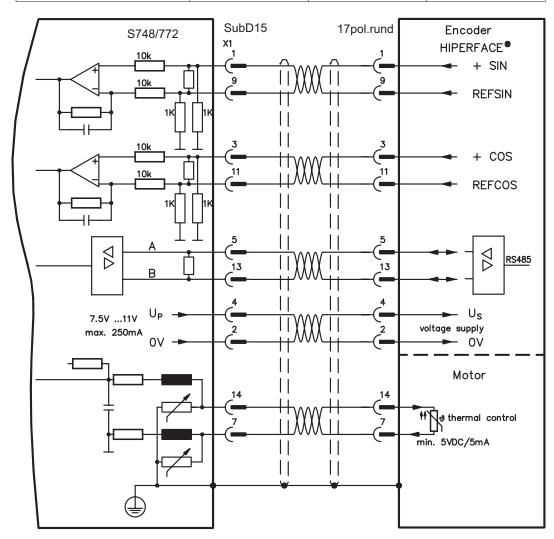

Wiring of a single-turn or multi-turn sine-cosine encoder with HIPERFACE interface as a feedback system (primary and secondary, ⇒ p.59).

The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable.

If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit (sin, cos): 350 kHz

Type	FBTYPE	EXTPOS	GEARMODE
HIPERFACE	2	9	9

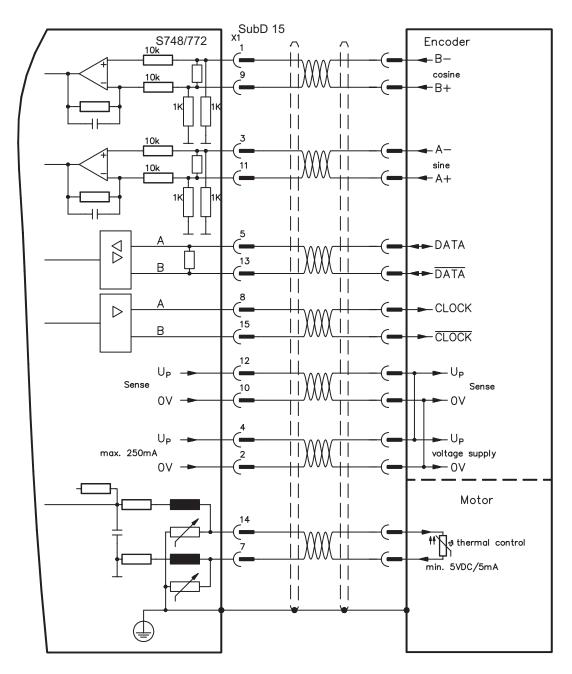

8.12.6 Sine Encoder with SSI (X1)

Wiring of sine-cosine encoder with SSI interface als Rückführsystem as a feedback system (primary, ⇒ p.59).

The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable. If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit (sin, cos): 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
5V digital	26	-	-

8.12.7 Sine Encoder without data channel (X1)

Frequency limit (sin, cos): 350 kHz

Wiring of a sine-cosine encoder without data channel as a feedback (primary and secondary, ⇒ p.59). Every time the 24V auxiliary voltage is switched on, the amplifier needs start-up information for the position controller (parameter value MPHASE). Depending on the feedback type either wake&shake is executed or the value for MPHASE is read out of the amplifier's EEPROM.

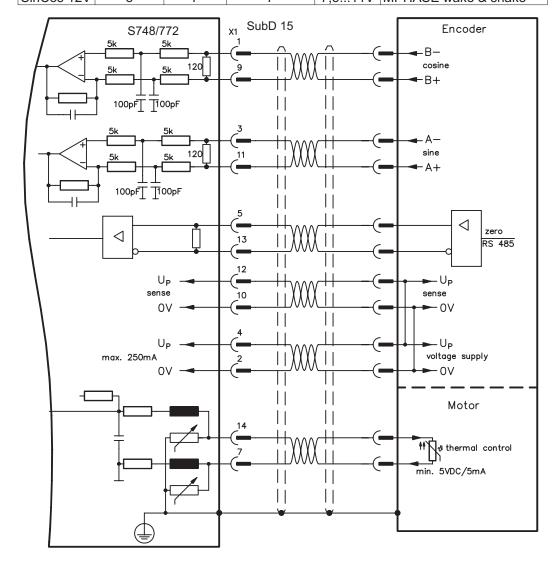

A WARNING

With vertical load the load could fall during wake&shake, because the brake is not active and torque is not sufficient to hold the load.

Don't use this feedback type with vertical load (hanging load).

The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. If lead lengths of more than 50m are planned, please consult our customer service.

Туре	FBTYPE	EXTPOS	GEARMODE	Up	Remarks
SinCos 5V	1	6	6	5V +/-5%	MPHASE from EEPROM
SinCos 12V	3	7	7	7,511V	MPHASE from EEPROM
SinCos 5V	7	6	6	5V +/-5%	MPHASE wake & shake
SinCos 12V	8	7	7	7.5 11V	MPHASE wake & shake

8.12.8 Sine Encoder with Hall (X1)

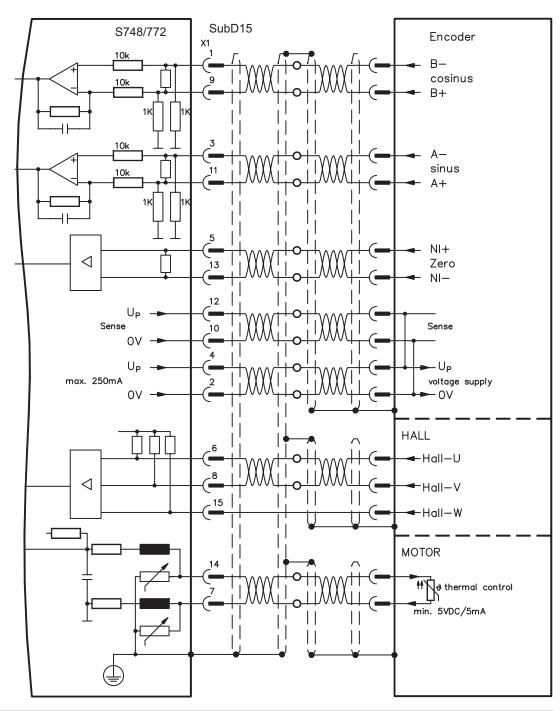

Feedback devices (incremental or sine-cosine), which don't deliver an absolute information for commutation, can be used as complete feedback system combined with an additional Hall encoder (primary, \Rightarrow p.59).

The thermal control in the motor is connected to X1 and evaluated there.

All signals are connected to X1 and evaluated there. If cable lengths of more than 25m are planned, please consult our customer service.

Frequency limit (sin, cos): 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE	Up
SinCos 5V with Hall	5	-	-	5V +/-5%
SinCos 12V with Hall	6	-	-	7,511V

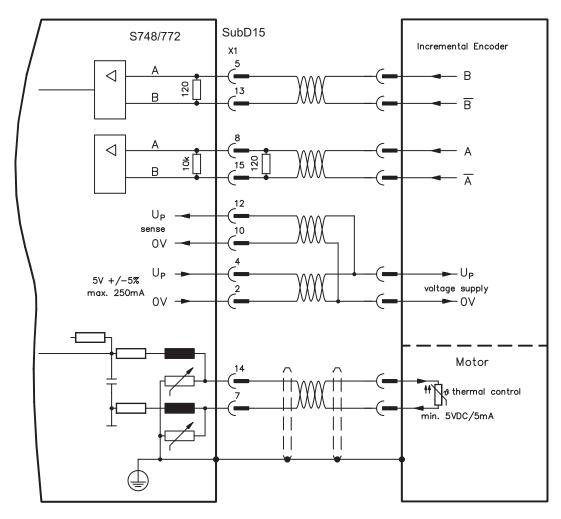

8.12.9 ROD (AquadB) 5V, 1.5MHz (X1)

Wiring of a 5V incremental encoder (ROD, AquadB) as a feedback (primary or secondary, ⇒ p.59). Every time the 24V auxiliary voltage is switched on, the amplifier need start-up information for the position controller (parameter value MPHASE). Depending on the setting of FBTYPE a wake&shake is executed or the value for MPHASE is taken out of the servo amplifier's EEPROM.

The thermal control in the motor is connected via the encoder cable to X1 and evaluated there. All signals are connected using our pre-assembled encoder connection cable. If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit (A, B): 1,5MHz

Туре	FBTYPE	EXTPOS	GEARMODE	Remarks
AquadB 5V	31	30	30	MPHASE from EEPROM
AquadB 5V	30	30	30	MPHASE wake & shake

8.12.10 ROD (AquadB) 5V, 350kHz (X1)

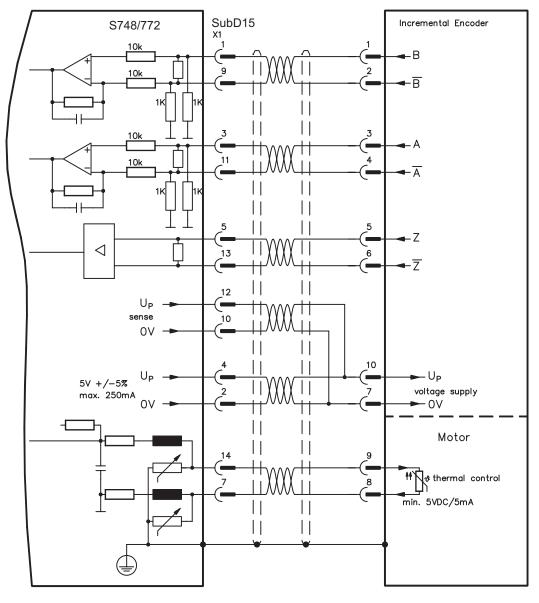

Wiring of a 5V incremental encoder (ROD, AquadB) as a feedback (primary or secondary, \Rightarrow p.59). Every time the 24V auxiliary voltage is switched on, the amplifier need start-up information for the position controller (parameter value MPHASE). With this feedback type the amplifier executes a wake&shake every time the 24V auxiliary voltage is switched on.

▲ WARNING

With vertical load the load could fall during wake&shake, because the brake is not active and torque is not sufficient to hold the load. Don't use this feedback type with vertical load (hanging load).

The thermal control in the motor is connected to X1 and evaluated there. If lead lengths of more than 50m are planned, please consult our customer service. Frequency limit (A, B): 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE	Remarks
AquadB 5V	27	10	10	MPHASE from EEPROM
AguadB 5V	17	10	10	MPHASE wake & shake

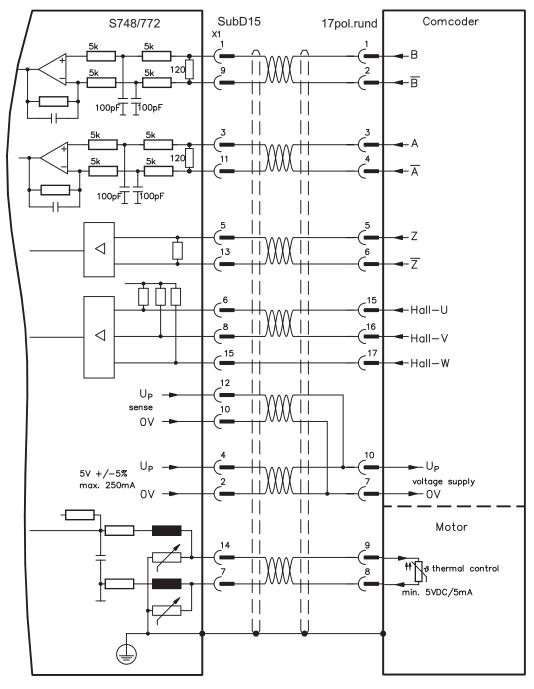

8.12.11 ROD (AquadB) 5V, 350kHz with Hall (X1)

Wiring of a ComCoder as a feedback unit (primary, ⇒ p.59). For the commutation hall sensors are used and for the resolution an incremental encoder.

The thermal control in the motor is connected to X1 and evaluated there. With our Com-Coder cable all signals are connected correctly. If cable lengths of more than 25m are planned, please consult our customer service. With separate feedback devices (Encoder and Hall are two devices) the wiring must be done similar to chapter 8.12.8, but the amplifier's pinout is identical to the wiring diagram shown below.

Frequency limit (A,B): 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
AquadB 5V + Hall	15	-	-

8.12.12 ROD (AquadB) 24V (X3)

Wiring of a 24V incremental encoder (ROD AquadB) as a feedback system (primary or secondary, ⇒ p.59). This uses the digital inputs DIGITAL-IN 1 and 2 on connector X3. Every time the 24V auxiliary voltage is switched on, the amplifier need start-up information for the position controller (parameter value MPHASE). With this feedback type the amplifier executes a wake&shake is executed every time the 24V auxiliary voltage is switched on.

A WARNING

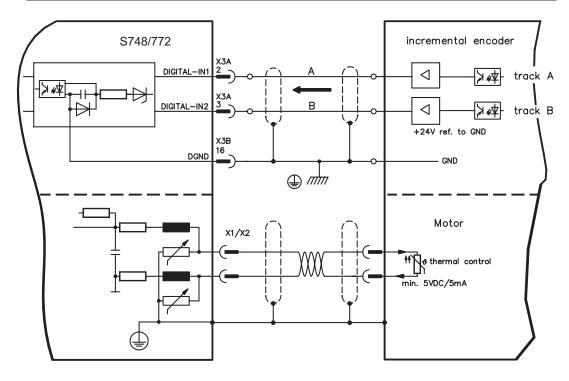

With vertical load the load could fall during wake&shake, because the brake is not active and torque is not sufficient to hold the load.

Don't use this feedback type with vertical load (hanging load).

The thermal control in the motor is connected to X1 or X2. If cable lengths of more than 25m are planned, please consult our customer service.

Frequency limit: 100 kHz, transition time $tv \le 0.1 \mu s$

Туре	FBTYPE	EXTPOS	GEARMODE	Remarks
AquadB 24V	12	2	2	MPHASE from EEPROM
AquadB 24V	16	2	2	MPHASE wake & shake

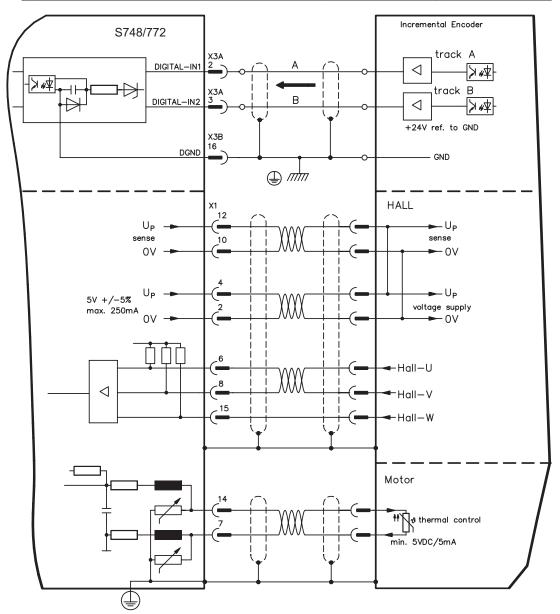

8.12.13 ROD (AquadB) 24V with Hall (X3, X1)

Wiring of a 24V incremental encoder (ROD, AquadB) and Hall sensors as a feedback unit (primary, ⇒ p.59). For the commutation hall sensors are used and for the resolution an incremental encoder.

The thermal control in the motor is connected to X1 and evaluated there. If cable lengths of more than 25m are planned, please consult our customer service.

Frequency limit X3: 100 kHz, X1: 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
AquadB 24V + Hall	14	-	-

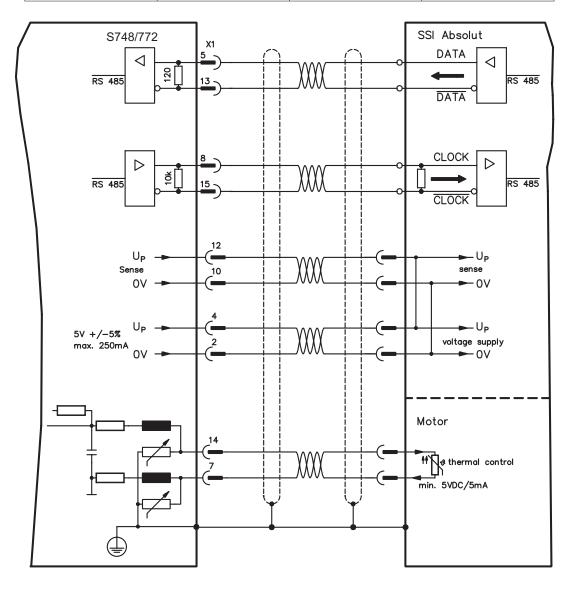

8.12.14 SSI Encoder (X1)

Wiring of a synchronous serial absolute-encoder as a feedback system (primary or secondary, \Rightarrow p.59). The signal sequence can be read in **Gray** code or in **Binary** (standard) code. The thermal control in the motor is connected to X1 and evaluated there. If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit: 1.5MHz Resolution/turn: max. 16 Bit

Turns: max. 16 Bit

Туре	FBTYPE	EXTPOS	GEARMODE
SSI	25	25	25

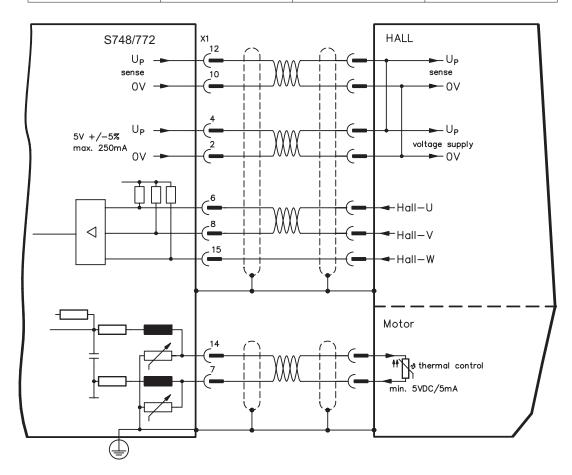

8.12.15 Hall sensors (X1)

Wiring of Hall sensors as a feedback unit (primary or secondary, ⇒ p.59).

The thermal control in the motor is connected to X1 and evaluated there. If cable lengths of more than 25m are planned, please consult our customer service.

Frequency limit: 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
Hall	11	-	-

8.13 Electronic Gearing, Master-slave operation

In the case of the "electronic gearing" functionality (see setup software and description of GEARMODE parameter), the servo amplifier is controlled by a secondary feedback device as a slave.

It is possible to set up master/slave systems, use an external encoder as a setpoint encoder or connect the amplifier to a stepper motor control.

The amplifier is parameterized using the setup software (electronic gearing, parameter GEARMODE).

The resolution (number of pulses per revolution) can be adjusted.

8.13.1 External Encoder types

The following types of external encoders can be used:

secondary Feedback type	Frequency limit	Connec- tor	Wiring diagram	GEARMODE
SinCos Encoder BISS digital	350kHz	X1	⇒ p.61	11
SinCos Encoder ENDAT 2.1	350kHz	X1	⇒ p.62	8
SinCos Encoder HIPERFACE	350kHz	X1	⇒ p.64	9
SinCos Encoder without data channel	350kHz	X1	⇒ p.66	6, 7
ROD* (AquadB) 5V	1.5MHz	X1	⇒ p.68	30
ROD* (AquadB) 5V	350kHz	X1	⇒ p.69	10
ROD* (AquadB) 24V	100kHz	X3	⇒ p.71	2
SSI 5V	350kHz	X1	⇒ p.73	25
Step/direction 5V	1.5MHz	X1	⇒ p.76	27
Step/direction 24V	100kHz	Х3	⇒ p.76	1

With a "Posl/O" or "Posl/O-Monitor" expansion card in slot 2 or 3, the following encoder types can be used:

secondary Feedback type	Frequency limit	Connec- tor	Wiring diagram	GEARMODE
SSI 5V	1.5MHz	X5	⇒ p.121	5
ROD* (AquadB) 5V	1.5MHz	X5	⇒ p.122	3
Step/direction 5V	1.5MHz	X5	⇒ p.122	4

^{*} ROD is an abbreviation for incremental encoder

8.13.2 Connection to stepper motor controllers (step and direction)

You can connect the servo amplifier to a third-party stepper-motor controller. Parameter setting for the slave amplifier is carried out with the aid of the setup software (electronic gearing). The number of steps can be adjusted, so that the servo amplifier can be adapted to match the step-direction signals of any stepper controller. Various monitoring signals can be generated.

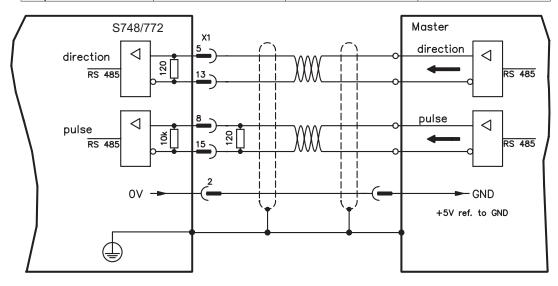

Using an A quad B encoder provides better EMC noise immunity.

8.13.2.1 Step/Direction with 5 V signal level (X1)

Wiring of the servo amplifier (SubD connector X1) to a stepper-motor controller with a 5V signal level. Frequency limit: 1.5 MHz

Туре	FBTYPE	EXTPOS	GEARMODE
Step/direction 5V	-	-	27

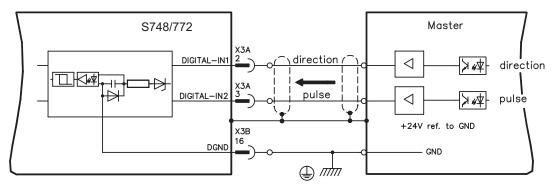

8.13.2.2 Step/Direction with 24 V signal level (X3)

Wiring of the servo amplifier to a stepper-motor controller with a 24 V signal level. Used are the digital inputs DIGITAL-IN 1 and 2 on connector X3.

Frequency limit: 100 kHz,

Туре	FBTYPE	EXTPOS	GEARMODE
Step/direction 24V	-	-	1
Otop/aircotion 2+v			

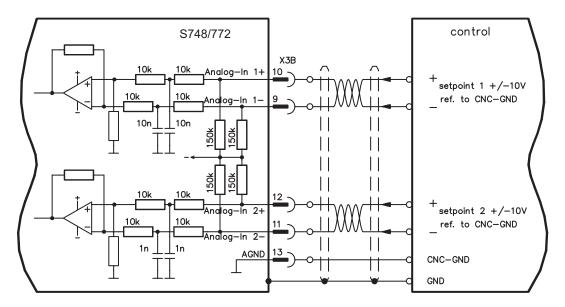

8.14 Digital and analog inputs and outputs

8.14.1 Analog Inputs (X3B)

The servo amplifier is fitted with two **programmable** differential inputs for analog setpoints. AGND (X3B/13) must always be joined to the GND of the controls as a ground reference.

Technical characteristics

- Differential-input voltage max. ± 10 V
- Ground reference AGND, terminal X3B/13
- Input resistance 150 kΩ
- Common-mode voltage range for both inputs ± 10 V
- Update rate 62.5 μs

Analog-In 1 input (terminals X3B/10-9)

Differential input voltage max. ± 10 V, resolution 16 Bit (accuracy 13 Bit), scalable. Standard setting: speed setpoint

Analog-In 2 input (terminals X3B/12-11)

Differential input voltage max. ± 10 V, resolution 16 Bit (accuracy 13 Bit), scalable. Standard setting: torque setpoint

Application examples for setpoint input Analog-In 2:

- adjustable external current limit
- reduced-sensitivity input for setting-up/jog operation
- pre-control / override

If an input was freshly assigned to a pre-programmed function, then the data set must be saved in the EEPROM of the servo amplifier and a reset has to be carried out (with the amplifier setup software for example).

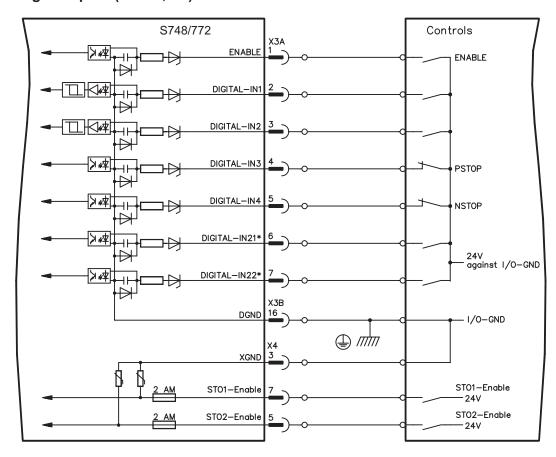

Defining the direction of rotation

Standard setting: clockwise rotation of the motor shaft (looking at the shaft end)

- Positive voltage between terminal X3B/10 (+) and terminal X3B/9 () or
- Positive voltage between terminal X3B/12 (+) and terminal X3B/11 ()

To reverse the direction of rotation, swap the connections to terminals X3B/10-9 or X3B/12-11 respectively, or change the COUNT DIRECTION parameter in the "Feedback" screen page.

8.14.2 Digital Inputs (X3A/B, X4)

^{*} DIGITAL-IN 21 and 22 must be defined as inputs using the setup software ("Digital I/O" screen page).

8.14.2.1 Connector X3A/B

Input ENABLE

- PLC compatible (IEC 61131-2 type 1), floating, reference ground is DGND
- High: 15...30 V / 2...15 mA , Low: -3...5 V / <1mA</p>
- Update rate: Software 250 µs

The output stage of the servo amplifier is enabled by applying the ENABLE signal (Terminal X3A/1, **active high**). Enable is possible only if input STO-Enable has a 24 V signal (see page 38ff). In the disabled state (low signal) the connected motor has no torque.

A software enable by means of the setup software is also required (AND link), although this can also be permanently enabled ("Basic Setup" screen page of the DRIVEGUI.EXE setup software).

Programmable digital inputs (X3):

You can use the digital inputs X3A/2...7 to initiate pre-programmed functions that are stored in the servo amplifier. A list of these pre-programmed functions can be found on the "Digital I/O" screen page of our setup software.

If an input was freshly assigned to a pre-programmed function, then the data set must be saved in the EEPROM of the servo amplifier and a reset has to be carried out (with the amplifier setup software for example).

Digital Inputs DIGITAL-IN 1...2 (X3A/2,3):

These inputs are particularly fast and are therefore suitable for latch functions or for high-speed feedback signals, for example.

- PLC compatible (IEC 61131-2 type 1), floating, reference ground is DGND
- High: 15...30 V / 2...15 mA , Low: -3...5 V / <1mA</p>
- Update rate: Hardware 2µs

Digital Inputs DIGITAL-IN 3...4 (X3A/4,5):

The PSTOP and NSTOP limit switch evaluation functions, for instance, can be assigned to these inputs. Choose the function you require in the setup software ("Digital I/O" screen page).

- PLC compatible (IEC 61131-2 type 1), floating, reference ground is DGND
- High: 15...30 V / 2...15 mA, Low: -3...5 V / <1mA</p>
- Update rate: Software 250 μs

Digital Inputs DIGITAL-IN 21...22 (X3A/6,7):

Pins 6 and 7 on X3A can be used as either inputs or outputs. Choose the function you require in the setup software ("Digital I/O" screen page).

- PLC compatible (IEC 61131-2 type 1), floating, reference ground is DGND
- High: 15...30 V / 2...15 mA, Low: -3...5 V / <1mA</p>
- Update rate: Software 250 µs

Depending on the selected function the inputs are high or low active.

8.14.2.2 Connector X4

Inputs STO1-ENABLE (X4/7), STO2-Enable (X4/5)

- Floating, reference ground is XGND
- 20V...30V / 33mA...45mA

These inputs are not compatible with IEC 61131-2.

These additional digital inputs release the power output stage of the amplifier as long as a 24 V signal is applied to these inputs. If one STOx-Enable input goes open-circuit, then power will no longer be supplied to the motor, **the drive will lose all torque and coast down to a stop.**

▲ CAUTION

Failsafe braking of the drive, if required, must be provided by means of an additional mechanical brake, since electrical braking by the drive is no longer possible.

You can thus achieve a restart lock-out for personnel safety by using the STOx-enable inputs in conjunction with an external safety circuit.

You can find further information and connection examples on page 38ff.

8.14.3 Digital Outputs (X3A/B, X4)

Technical characteristics

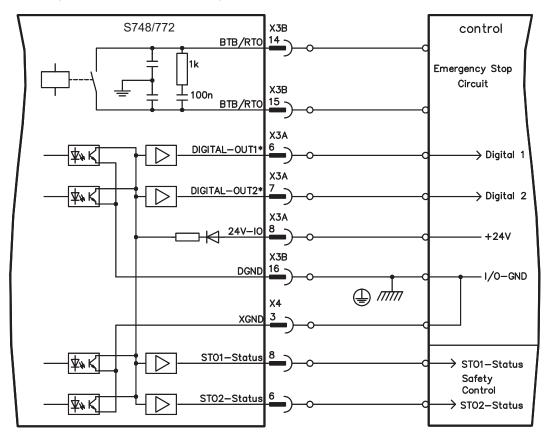

Power supply at terminals X3A/8 (24V-IO) and X3B/16 (DGND)

All digital outputs are floating

— 24V-IO : 20V DC ... 30V DC

DIGITAL-OUT1 / 2 : PLC compatible (IEC 61131-2 type 1), max. 100mA STO1/2-Status : PLC compatible (IEC 61131-2 type 1), max. 100mA BTB/RTO : Relay output, max. 30V DC oder 42V AC, 0.5A

— Update rate : 250 μs

^{*} DIGITAL-OUT 1 and 2 must be defined as outputs using the setup software ("Digital I/O" screen page).

8.14.3.1 Connector X3A/B

Ready-to-operate contact BTB/RTO (X3B/14,15)

Operational readiness (terminals X3B/14 and X3B/15) is signaled by a **floating** relay contact. The contact is **closed** when the servo amplifier is ready for operation, and the signal is **not** influenced by the enable signal, the I²t-limit, or the brake threshold.

All faults cause the BTB/RTO contact to open and the output stage to be switched off (if the BTB/RTO contact is open, the output stage is inhibited -> no power output). A list of the error messages can be found on page 102.

Programmable digital outputs DIGITAL-OUT 1 / 2 (X3A/6,7):

Pins 6 and 7 on X3A can be used as either inputs or outputs. Choose the function you require in the setup software. The outputs are floating outputs, so the 24 V switching voltage must be provided by an external supply via X3A/8.

If they are programmed as digital outputs, messages from pre-programmed functions stored in the servo amplifier can be output here.

A list of these pre-programmed functions can be found on the "I/O digital" screen page of our setup software.

If an output is to be freshly assigned to a pre-programmed function, then the parameter set must be saved in the EEPROM of the servo amplifier and a reset has to be carried out (with the amplifier setup software for example).

8.14.3.2 Connector X4

Status messages STO1-Status (X4/8) and STO2-Status (X4/6):

Pin 6 and 8 on X4 report the status of the STO-Enable inputs. The outputs are floating outputs, so the 24 V switching voltage must be provided by an external supply via X3A/8.

8.15 RS232 interface, PC connection (X6)

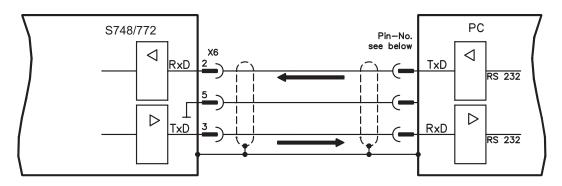

Operating, position control, and motion-block parameters can be set up by using the setup software on an ordinary commercial PC (see p.89).

Connect the PC interface (X6) of the servo amplifier to a serial interface on the PC via a null-modem cable, while the supply to the equipment is switched off.

Do not use a null-modem power link cable!

This interface has the same electrical potential as the CANopen interface.

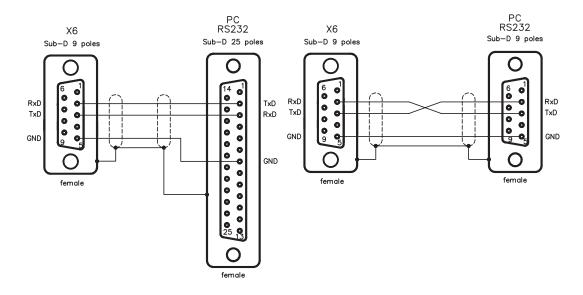

The interface is selected and set up in the setup software.

Further notes on page 88.

With the optional Y-adapter (splitter), the two interfaces for RS232 and CAN, which would otherwise use the same connector X6, are separated out onto two connectors (see accessories manual).

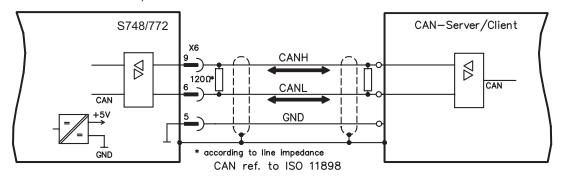

Interface cable between the PC and servo amplifiers of the S748/772 series:

(View: looking at the solder side of the SubD sockets on the cable)

8.16 CANopen interface (X6)

The interface for connection to the CAN-bus (default: 500 kBaud). The integrated profile is based on the CANopen DS301 communication profile and the DS402 drive profile. The following functions are available in connection with the position controller: Jogging with variable speed, homing run (zeroing to reference), start motion task, start direct task, digital setpoint provision, data transmission functions and many others. Detailed information can be found in the CANopen manual. The interface is at the same electrical potential as the RS232 interface. The analog setpoint inputs can still be used. With the optional Y-adapter (splitter), the two interfaces for RS232 and CAN, which would otherwise use the same connector X6, are separated out onto two connectors (see accessories manual).

CAN-bus cable

To meet ISO 11898, a bus cable with a characteristic impedance of 120 Ω should be used. The maximum usable cable length for reliable communication decreases with increasing transmission speed. As a guide, you can use the following values which we have measured, but they are not to be taken as assured limits:

Cable data:Characteristic impedance $100\text{-}120\ \Omega$ Cable capacitancemax. 60 nF/km

Lead loop resistance 159.8 Ω /km

Cable length, depending on the transmission rate

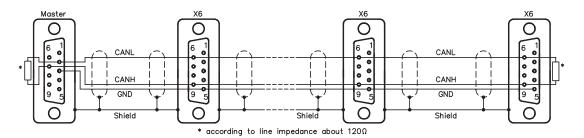

Transmission rate (kBaud)	max. cable length (m)
1000	10
500	70
250	115

Lower cable capacitance (max. 30 nF/km) and lower lead resistance (loop resistance, 115 Ω /km) make it possible to achieve greater distances.

(Characteristic impedance 150 \pm 5 Ω \Rightarrow terminating resistor 150 \pm 5 Ω).

For EMC reasons, the SubD connector housing must fulfill the following requirements:

- metal or metalized housing
- provision for cable shielding connection on the housing, large-area connection

8.17 EtherNet interface (X7)

This interface with its two RJ-45 connectors can be used for communicating with various fieldbus devices depending on the used firmware version:

- EtherCAT(standard, CAN over EtherCAT)
- SYNQNET (in process)
- PROFINET (in process)
- Ethernet IP (in process)
- SERCOS III (in process)
- Ethernet TCP/IP (in process)

The interface is deactivated, if a field bus extension card is inserted to an extension slot.

The protocol that has been installed with the firmware must be enabled (ASCII command ETHMODE).

With the Download Tool (on the product CDROM and within the download area of our website) the different firmware versions can be loaded into the servo amplifier.

The communication status is indicated by the built-in LEDs.Der Zustand der Kommunikation wird über die integrierten LEDs gemeldet.

Connector	LED#	Name	Function
	LED1	LINK_IN	ON = receive valid (IN port)
	LEDI		OFF= not valid, power off or reset.
X7A			ON = network cyclic
	LED2	CYCLIC	BLINK = network not cyclic
			OFF = power off or reset
	LED3	LINK OUT	ON = receive valid (OUT port)
	LEDS	LINK_OUT	OFF = not valid, power off or reset
X7B			ON = repeater on, network cyclic
	LED4	REPEATER	BLINK = repeater on, network not cyclic
			OFF = repeater off, power off or reset

8.18 Memory Card

In the top of the servo amplifier there is a card reader for memory cards. The firmware and a full set of parameters (with control buttons and setup software) can be stored on the memory card and reloaded onto the servo amplifier. MMC and SD cards are supported.

This function means that a replacement device or identical shafts in standard production machines can be set up very quickly and easily.

Uploads and Downloads from and to the memory card can be started with the keypad or with the setup software using.

To run new firmware on an amplifier without a PC connection, proceed as follows:

- 1. Save the firmware to be programmed onto a memory card under the name "default.s19" (S-record format) or "default.bin" (binary format).
- 2. Disconnect the power to the amplifier (24 V supply OFF) and insert the card in the memory card slot on the amplifier.
- 3. Press and hold down both operating keys () and switch on the 24 V supply voltage to the amplifier. "—" appears in the display to indicate that the monitor program has been activated. In case of access problems the drive display shows the letters "CCC". The interrupted command proceeds after re-insertion of the memory card.
- 4. Press both operating keys again to start the update process. The progress of the update can be monitored in the display:
 - First, the firmware is downloaded from the card to the internal memory.
 - During this phase, the display counts from 0 to 100.
 - Next, the internal firmware memory is deleted. During this phase, 100 is displayed permanently.
 - Once the firmware memory has been deleted, the firmware is written.
 This phase is indicated in the display by the display counting backwards from 100 to 0.
- 5. Once programming has been completed, the firmware is started automatically.

The parameter file can also be loaded automatically on a restart. If a parameter file with the name "default.par" has already been saved on the memory card, it will be loaded by the firmware at this point. This allows fully automatic updating of the firmware/parameters.

This page has been deliberately left blank.

9 Setup

The procedure for setup is described as an example. Depending on the application, a different procedure may be appropriate or necessary. In multi-axis systems, set up each servo amplifier individually.

9.1 Safety Instructions

▲ DANGER

The equipment produces potentially lethal voltages up to 900 V. Check that all connection components that are live in operation are safely protected against bodily contact.

▲ WARNING

Never undo the electrical connections to the servo amplifier while it is live. Capacitors can still have dangerous residual charges up to 10 minutes after switching off the supply voltage.

▲ CAUTION

The heat sink and front panel of the amplifier can reach temperatures up to 80°C in operation. Check the heat sink temperature. Wait until the heat sink has cooled down to 40°C before touching it.

A CAUTION

Before setting up, the manufacturer of the machine must generate a hazard analysis for the machine, and take appropriate measures to ensure that unforeseen movements cannot cause injury or damage to any person or property.

▲ CAUTION

Only professional personnel with extensive knowledge in the fields of electrical engineering and drive technology are allowed to setup the servo amplifier.

NOTICE

If the servo amplifier has been stored for more than 1 year, it will be necessary to re-form the capacitors in the DC bus link circuit.

To do this, disconnect all electrical connections and apply single-phase 208...240 V AC to terminals L1 / L2 of the servo amplifier for about 30 minutes. This will re-form the capacitors.

Additional information on setting up the equipment:

The adaptation of parameters and the effects on the control loop behavior are described in the online help of the setup software.

The setting up of any expansion card that may be fitted is described in the corresponding manual on the CD-ROM.

We can provide further know-how through training courses (on request).

9.2 Setup software

9.2.1 General

This chapter describes the installation of the setup software DRIVEGUI.EXE for the S748/772 digital servo amplifiers.

We offer training and familiarization courses on request.

9.2.1.1 Use as directed

The setup software is intended to be used for altering and saving the operating parameters for the S748/772 series of servo amplifiers. The attached servo amplifier can be set up with the help of this software, and during this procedure the drive can be controlled directly by the service functions.

▲ WARNING Only professional personnel who have the relevant expertise described on page 7 are permitted to carry out online parameter setting for a drive that is running. Sets of data that have been stored on data media are not safe against unintended alteration by other persons. Unexpected move could be the result if you use unchecked data.

> After loading a set of data you must therefore always check all parameters before enabling the servo amplifier.

9.2.1.2 Software description

The servo amplifiers must be adapted to the requirements of your machine. Usually you will not have to carry out this parameter setting yourself on the amplifier, but on a PC, with the assistance of the setup software. The PC is connected to the servo amplifier by a null-modem cable (serial, see p.82). The setup software provides the communication between the PC and S748/772.

You can find the setup software on the accompanying CD-ROM and in the download area of our website.

With very little effort you can alter parameters and instantly observe the effect on the drive, since there is a continuous (online) connection to the amplifier. At the same time, important actual values are read out from the amplifier and displayed on the monitor of the PC (oscilloscope functions).

Any interface modules (expansion cards) which may be built into the amplifier are automatically recognized, and the additional parameters which are required for position control or motion-block definition are made available.

You can save sets of data on data media or on the memory card (archiving) and load them again. You can also print out the data sets.

We supply you with motor-specific default sets of data for the most common combinations of servo amplifier and motor. In most applications you will be able to use these default values to get your drive running without any problems.

An extensive online help with integrated description of all variables and functions supports you in each situation.

9.2.1.3 Hardware requirements

The PC interface (X6, RS232) of the servo amplifier is connected to the serial interface of the PC by a null-modem cable (**not a null-modem link cable!**) (⇒ p.82).

NOTICE

Connect / disconnect the interface cable only when the electrical supply is switched off for both the PC and the servo amplifier.

The interface in the servo amplifier has the same potential level as the CANopen interface

Minimum requirements for the PC:

Processor : at least Pentium[®] II or comparable

Operating system : WINDOWS 2000 / XP
Graphics adapter : Windows compatible, color

Drives : hard disk with at least 10 MB free space

CD-ROM drive

Interface : one free serial interface (COM1 ... COM10)

or USB with an USB->Serial converter

9.2.1.4 Operating systems

WINDOWS 2000 / XP

DRIVEGUI.EXE will run under WINDOWS 2000 and WINDOWS XP.

Emergency operation is feasible through an ASCII terminal emulation (without graphical user interface).

Interface settings: 38400 bps, databit 8, no parity, stopbit 1, no flow control

Unix, Linux

The functioning of the software has **not** been tested for WINDOWS running within Unix or Linux.

9.2.2 Installation under WINDOWS 2000 / XP

The CD-ROM includes an installation program for the setup software.

Installation

Autostart function activated:

Insert the CD-ROM into a free drive. A window with the start screen opens. There you find a link to the setup software DRIVEGUI.EXE. Click it and follow the instructions.

Autostart function deactivated:

Insert the CD-ROM into a free drive. Click on **START** (task bar), then on **Run**. Enter the program call: **x:\index.htm** (x = correct CD drive letter).

Click **OK** and proceed as described above.

Connection to the serial interface of the PC:

Connect the interface cable to a serial interface on your PC (COM1 to COM10) and to the serial interface of the servo amplifier S748/772 (⇒ p.82).

9.3 Quickstart

9.3.1 Preparation

9.3.1.1 Unpacking, Mounting and Wiring the Servo Amplifier

- 1. Unpack servo amplifier and accessories
- 2. Observe safety instructions in the manuals
- 3. Mount the servo amplifier as described in chapter 7
- 4. Wire the servo amplifier as described in chapter 8 or apply the minimum wiring for drive testing as described in chapter 9.3.1.3
- 5. Install the software as described in chapter 9.2
- 6. You need this information concerning the drive components:
 - rated mains supply voltage
 - motor type (motor data, if the motor type is not listed in the motor database: see Online Help)
 - feedback unit built into the motor (type, poles/lines/protocol etc.)
 - moment of inertia of the load

9.3.1.2 Documents

You need access to these documents (located on the product CD-ROM, you can download the latest editions from our website):

- Instructions manual (this manual)
- CANopen communication profile manual
- Accessories manual

Depending on the installed expansion card you need one of these documents:

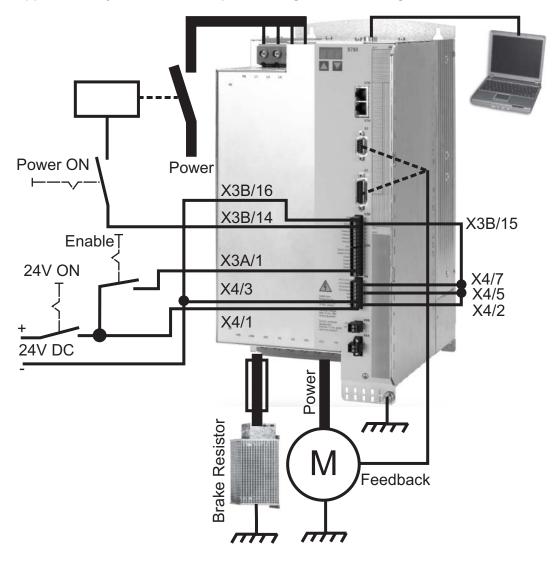

- PROFIBUS DP communication profile manual
- DeviceNet communication profile manual
- SERCOS communication profile manual
- EtherCAT communication profile manual

You need Acrobat Reader to read the PDFs, an installation link is on every screen of the product CD-ROM.

9.3.1.3 Minimum Wiring for Drive Test

▲ CAUTION

This wiring does not fulfill any requirements to safety or functionality of your application, it just shows the required wiring for drive testing without load.

9.3.2 Connect

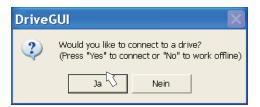

- Connect the interface cable to a serial interface on your PC and to the serial interface
 X6 of the servo amplifier. USB to serial converter can be used optionally.
- Switch on the 24 V power supply for the servo amplifier.
- Wait about 30 seconds, until the front display of the servo amplifier displays the current class (e.g. 6 8 6 for 48 A) If the power supply voltage is switched on, too, a leading P is displayed (e.g. 6 8 6 for Power, 48 A).

If a fault code ($\blacksquare \blacksquare \blacksquare$) or a warning ($\blacksquare \blacksquare \blacksquare$) or a status message ($J_{-}/$ E/S) appears in the display, you will find the description on page 102 / 103. If there is fault, fix the problem.

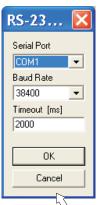

Double-Click the DRIVEGUI.EXE icon on your Windows desktop to start the software.

You can work offline or online with DRIVEGUI.EXE.
Work ONLINE now.

If the communication is started for the first time, you have to setup the communication parameters.

Choose the communication system and the interface, where the servo amplifier is connected to.

Click OK.

The software tries to communicate with these parameters. If it's not successful, you receive this error message:

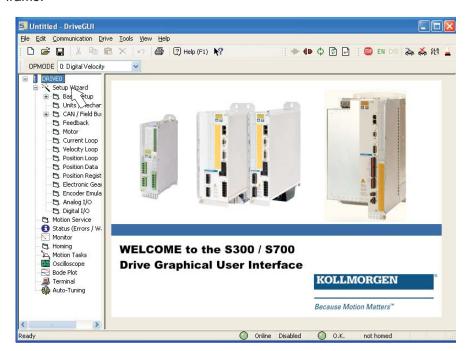

Frequent causes:

- wrong interface chosen
- wrong connector chosen at the servo amplifier
- interface is used by another software
- 24 V auxiliary voltage for the servo amplifier not working
- interface cable broken or wrong wiring

Quit the error message. The software starts in the offline mode now, that requires the manual selection of the amplifier's type. Quit this selection by closing the window. Fix the communication problem. Restart the software in Online mode.

If communication works, you see the start screen. Select "Setup Wizard" in the navigation frame.

NOTICE

Make sure, that the amplifier is disabled (Input Enable connector X3A pin 1 must be 0 V or open)!

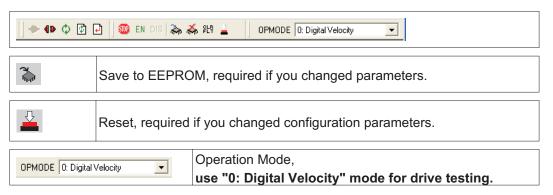

9.3.3 Important Screen Elements

Help Function

The Online-Help gives detailed information to all parameters the servo amplifier can work with.

Key F1	Starts Online Help for the actual screen page.	
Menu bar Help	Starts Online Help with the first page.	
	Context Help. Click the help symbol first. Then click the function for which you need help.	

Tool Bar

Status Bar

The status bar shows a green Online symbol, indicating that the communication works.

9.3.4 Setup Wizard

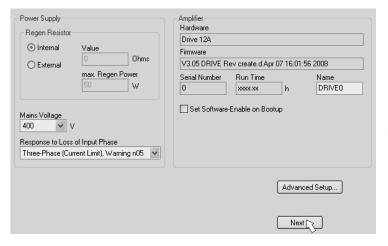

The Setup Wizard leads you through the necessary steps for configuring your servo amplifier. Depending on the selected application, only the active screen pages are necessary.

For a quick setup / drive test, select the setup type "Quick Motor/Drive Setup".

Start the Wizard.

9.3.4.1 Basic Setup

Basic parameters are set here.

Mains Voltage: Select the connected mains voltage level

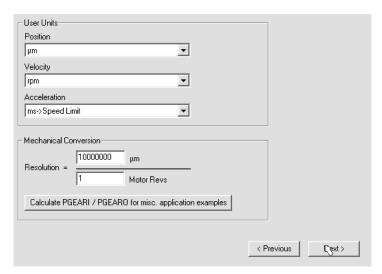

Response to Loss of Input Phase: Select Single-Phase or Three-Phase operation. With three-phase operation you can select either warning "n05" or error "F19" in case of phase loss. The reaction "F19" disables the output stage, "n05" is just a message.

Name: You can enter a name for the servo amplifier (up to 8 characters). This simplifies the drive identification in the system.

Set Software Enable on Bootup: Don't select this option for the quick test.

Click NEXT.

9.3.4.2 Units/Mechanical

The user units for all input fields in the setup software can be preselected here.

Position, Velocity, Acceleration

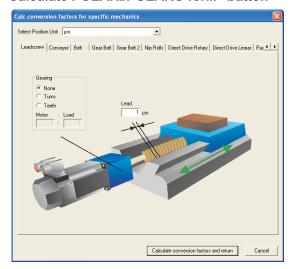

Select usable units for your application referring to the moved load.

Mechanical Conversion

The relationship between motor shaft revolution (pole pait pitch with linear motors) and motion distance of the load is specified here. Gear ratio can be calculated here as well. Detailed information can be found in the online help.

Use the tool based on sample applications for calculating the resolution value:

Calculate PGEARI/PGEARO for..." button

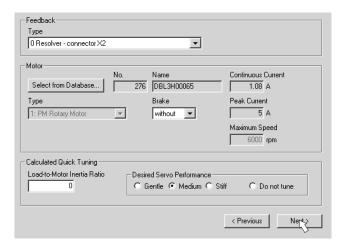

If your application does not correspond to any of the listed examples, enter the required parameters directly in the fields on the "Units" screen.

First, select the application that corresponds to your own. Next, set the position unit. Select the position unit that provides you with the required accuracy for your application. Set the mechanical data for you application now. If a gearhead is flange-mounted on the motor, you must also enter the gearhead data (either the number of teeth or the ratio of the revolutions).

Then click the "Calculate conversion factors and return" button.

Click NEXT.

9.3.4.3 Motor (rotatory) / Feedback

Simplified setting of the motor related parameters.

Feedback: Select the feedback system used in the motor.

Resolver is fixed to 2 pole in the Quick Motor/Drive Setup.

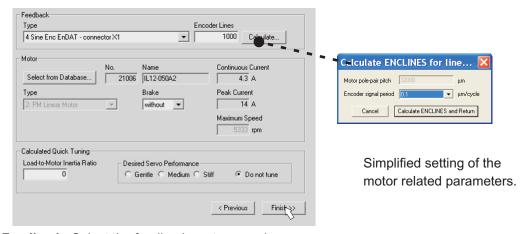

Change "pole n°" on feedback screen in Complete Setup later, if required.

Motor type: Click the button "Select from Database...".

Open the database file (mdb___.csv) and select the used motor out of the list. Special motors must be defined in the "Complete Setup".

Brake: If the amplifier shall control a brake, change the Brake parameter to "With" **Calculated quick tuning:** If you know the Load-to-motor inertia ratio (0 is for no load), enter the number here and select the desired servo performance. If you don't know the inertia ratio, select "Do not tune". **Click FINISH.**

9.3.4.4 Motor (linear) / Feedback (Encoder)

Feedback: Select the feedback system used.

Motor type: Click the button "Select from Database..".

Open the database file (mdb___.csv) and select the used motor. Special motors must be defined in the "Complete Setup".

Encoder Lines (appears with Feedback Type Sine Encoder):

Click "Calculate" and fill in the Encoder signal period.

Brake: If the amplifier shall control a brake, change the Brake parameter to "With" **Calculated quick tuning:** If you know the Load-to-motor inertia ratio, enter the number here and select the desired servo performance. Otherwise select "Do not tune".

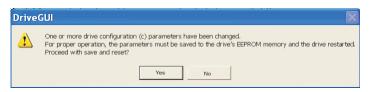

Click FINISH.

9.3.4.5 Save Parameters and Restart

You are going to finish the Setup Wizard and you have changed several basic parameters. Depending on the parameters you changed, two possible reactions will occure now:

Configuration parameters changedt

A warning appears, that you have to restart the amplifier, this is called "coldstart".

Click "YES".

The parameters are saved to the amplifier's EEPROM automatically and a reset command restarts the amplifier (takes some seconds).

Other parameters changed

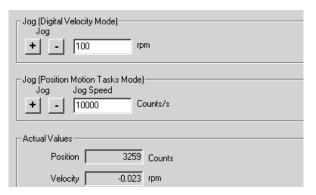

No warning appears. Save the parameters to the EEPROM of the servo amplifier manually by clicking the symbol in the tool bar. A coldstart of the amplifier is not necessary. Select the screen "**Motion Service**" in the navigation frame.

9.3.5 Motion Service (Jog Mode)

NOTICE

Be aware that the actual position of the load permits the subsequent moving operations. The axis could move to the hardware limit-switch or the mechanical stop. Make sure that a jerk or a fast acceleration of the load cannot cause any damage.

- Switch on the power supply for the drive.
- STOx-Enable: Apply +24 V to the inputs STO1/2-Enable [X4/5 and 7]
- **Hardware-Enable**: Apply +24 V to the input Enable [X3A/1]. If STO-Enable is missed or the sequence was wrong, the front display shows 🖁 🗒 🗒 .
- Software-Enable: Click the symbol EN ithe tool bar. Now the front display shows an E and the current class (e.g. 88 for Enable, 3A). Click the symbol to switch off the output stage (disable)..

Jog (Digital Velocity Mode):

You can move the drive with constant speed. Enter the desired speed.

CAUTION: Observe the "safe reduced speed" requirements for your application!

The drive moves with the preset speed when the + or – button is pressed. It stops when the button is released.

Actual errors and warnings are listed on the screen "**Status**". A description of errors/warnings can be found in the online help or on p.102ff.

Now you have setup and tested the basic functions of the drive successfully.

9.3.6 More Setup Screens

▲ CAUTION

Observe the safety instructions in the manuals and in the online help before you change parameters in the additional setup screens.

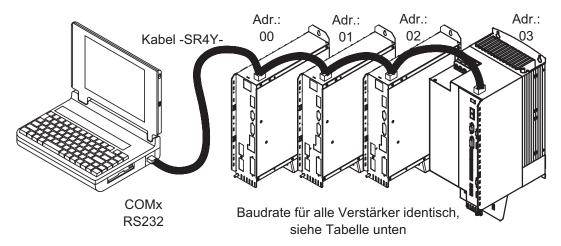

For all setup functions detailed information can be found in the Online Help system and the integrated command reference.

Select "Complete Setup" in the Setup-Wizard. Now you have access to:

- CAN-/Fieldbus-settings: setup adress and baudrate
- Feedback: Adjust the used feedback unit
- Motor: Adjust the used motor
- Control Loops: Current-, Velocity- and Position-Loops can be optimized
- Position Data: Adjust the position control for the requirements of your application.
- Position Registers: up to 16 position values in the motion way can be monitored.
- Electronic Gearing: If the servo amplifier will follow a setpoint as a slave with a gear ratio, you can select the gearing source here and define the gear ratio.
- Encoder Emulation: select the encoder emulation (position output)
- Analog I/O: setup the analog inputs
- Digital I/O: setup the digital inputs and outputs
- Status (Errors/Warnings): displays amplifiers data with history, actual faults/warnings
- Monitor: displays the drive data (actual values)
- Homing: definition and start of homing
- Motion task: definition and start of motion task
- Oscilloscope: 4 channel oscilloscope with multiple functionality
- Bode Plot: tool for optimizing the drive
- Terminal: setup the servo amplifier with ASCII commands
- Expansion Card: depending on the built-in expansion card a menu appearst
- Autotuning: fast optimizing the velocity controller

9.4 Multi axis system

With a special cable you can connect up to 255 servo amplifiers to your PC: cable type -SR6Y- (for four aplifiers) or -SR6Y6- (for six amplifiers) see Accessories Manual.

With the PC connected to only one amplifiers you can select every amplifier in the system via the set station address with the setup software.

9.4.1 Station address for CAN-bus

You can use the keypad on the front panel to preset the station addresses for the individual amplifiers and the baud rate for communication (⇒ p.101). Usually the setup software is used to set all parameters.

9.4.2 Baud rate for CAN-bus

After changing the station address and baud rate you must turn the 24V auxiliary supply for the servo amplifier off and on again.

Coding of the Baud rate in the LED display:

Coding	Baud rate in kbit/s	Coding	Baud rate in kbit/s
1	10	25	250
2	20	33	333
5	50	50	500
10	100	66	666
12	125	80	800
		100	1000

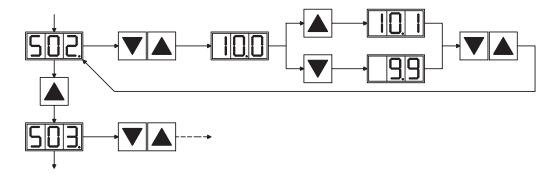

9.5 Keypad operation / LED display

This section illustrates the two possible operating menus and the use of the keys on the front panel. Normally, the S748/772 only presents the standard menu for your use. If you want to operate the amplifier via the detailed menu, you must keep the right key pressed while switching on the 24V supply.

9.5.1 Keypad operation

The two keys can be used to perform the following functions:

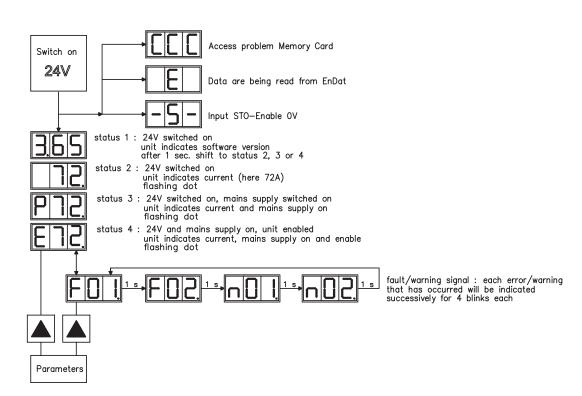

Key symbol	Functions		
	press once : move up one menu item, increase number by one		
	press twice in rapid succession : increase number by ten		
	press once : decrease number by one		
	press twice in rapid succession : decrease number by ten		
	hold right key pressed, and then press left key as well:		
	to enter a number, "Return" function		

9.5.2 Status display

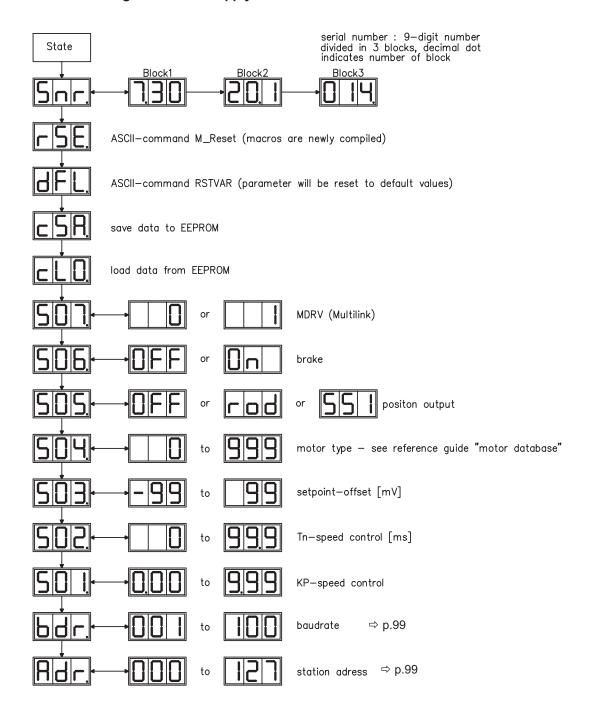

9.5.3 Standard menu

9.5.4 Advanced menu

To operate the amplifier via the detailed menu, you must keep the right key pressed while switching on the 24 V supply.

9.6 Error messages

Any errors that occur are shown in coded form by an error number in the LED display on the front panel. All error messages result in the BTB/RTO contact being opened, the output stage being switched off (motor loses all torque), and the holding brake is activated.

Number	Explanation	
E/P	Status Messages	Status messages, no error, see p. 100
	Status Message	Amplifier is updating the startup configuration
-	Status Message	Status message, no error, programming mode
- S -	STO-Enable	STOx-Enable input is 0V (with disabled drive only)
CCC	Memory Card	Access problems memory card
F01	Heat Sink Temperature	Heat sink temperature too high (default: 80°C)
F02	Overvoltage	Overvoltage in DC bus link. Limit depends on the electrical supply voltage
F03	Following Error	Message from the position controller
F04	Feedback	Cable break, short-circuit, short to ground
F05	Undervoltage	Undervoltage in DC bus link (default: 100 V)
F06	Motor Temperature	Motor temperature too high or temp. sensor defect
F07*	Internal Voltages	Internal supply voltages not ok
F08	Overspeed	Motor runs away, speed is too high
F09*	EEPROM	Checksum error
F10	Reserved	Reserved
F11	Brake	Cable break, short-circuit, short to ground
F12	Motor Phase	Motor phase missing (cable break or similar), in process
F13	Ambient Temperature	Ambient temperature too high
E4.4*	O t t. Ot	Fault in the power output stage, also with wrong
F14*	Output Stage	motor cable or insufficient cable shielding
F15	I ² t max.	I ² t maximum value exceeded
F16	Mains BTB/RTO	2 or 3 phases missing in the mains supply feed
F17*	A/D Converter	Error in the analog-digital conversion, normally caused by extreme electromagnetic interference
F18	Brake Circuit	Brake circuit faulty or incorrect setting
F19	Phase error	Mains phase missed
F20*	Slot Error	Slot error, depends on the type of expansion card (see ASCII object reference)
F21	Handling Freez	, ,
F21	Handling Error Reserved	Handling error on the expansion card Reserved
F23 F24	CAN-Bus Off	Severe CAN bus communication error Warning is displayed as fault
F24 F25	Warning Commutation Error	
F25 F26	Limit Switch	Commutation error Hardware limit switch error on homing move
1.770	LITTIL SWILGT	Operational error with STO, inputs for STO-Enable
F27	STO	and ENABLE have been set at the same time
F28	Fieldbus Error	Fieldbus error (see ASCII command reference)
F29	Fieldbus Error	Fieldbus error (see ASCII command reference)
F30	Emergency Timeout	Timeout emergency stop
F31	Reserve	Reserve
F32*	System Error	System software not responding correctly

^{* =} from Firmware Version 3.62 (with DRVCNFG3=16): fault reset by hardware reset of the servo amplifier. All other faults can be reset by ASCII command CLRFAULT.

More information to the messages can be found in the ASCII Object Reference (Online Help), see parameter ERRCODE. Hints for removal can be found in the Online help chapter "Trouble-Shooting".

9.7 Warning messages

Faults which occur, but which do not cause a switch-off of the amplifier output stage (BTB/RTO contact remains closed), are indicated in the LED display on the front panel by a coded warning number.

Number	Designation	Explanation			
E/P	Status Messages	Status messages, no error, see p. 100			
	Status Message	Amplifier is updating the startup configuration			
- S -	STO-Enable	STO-Enable input is 0V (with disabled drive only)

^{* =} these warning messages result in a controlled shut-down of the drive (braking by emergency stop ramp)

More information to the messages can be found in the ASCII Object Reference (Online Help), see parameter STATCODE. Hints for removal can be found in the Online help chapter "Trouble-Shooting".

9.8 Trouble Shooting

There may be a wide variety of reasons for the fault, depending on the conditions in your installation. In multi-axis systems there may be further hidden causes of a fault.

Detailled hints for removal of faults can be found in the Online help chapter "Trouble-Shooting".

Our customer service can give you further assistance with problems.

10 Expansions

You can find information about availability and order numbers on page 133.

10.1 Expansion cards for slot 1

10.1.1 Guide to installation of expansion cards in slot 1

1 - Boundary of SLOT1

2 - Detach the film (at the perforations)

3 - Tear off the film (as far as the mark)

4 - Break the top rib

5 - Break the bottom rib

6 - Pull out the top plate

7 - Pull out the bottom plate

8 - Push in the card

9 - Fasten the screws

10.1.2 Expansion card -I/O-14/08-

This section describes the additional features that the expansion card -I/O-14/08- provides for the S748/772. If you ordered the expansion card together with the servo amplifier, then it will be delivered already inserted into the expansion slot of the servo amplifier and screwed in place.

The -I/O-14/08- provides you with 14 additional digital inputs and 8 digital outputs. The functions of the inputs and outputs are adjustable with the setup software.

The I/Os are used to initiate the motion tasks that are stored in the servo amplifier and to evaluate signals from the integrated position control in the higher-level control system. The functions of the inputs and signal outputs correspond to the functions that can be assigned to the digital I/Os on connector X3. All inputs and outputs are electrically isolated from the servo amplifier by optocouplers.

10.1.2.1 Front view

24V / 7mA PI C-compatible IFC 61131

10.1.2.2 Technical data

Control inputs

Control Inputs	24V//IIIA, FLO-compandie, ILO 01131		
Signal output	24V / max. 500mA , PLC-compatible, IEC 61131		
	24V (18 36V) / 100mA plus total current of the out-		
	puts (depends on the input wiring of the controls)		
Supply inputs, to IEC 61131	The 24V DC voltage must be supplied by an		
	electrically isolated power supply (e.g. with		
	isolating transformer).		
Fusing (external)	4 AT		
Connectors	MiniCombicon, 12-pin, coded on PIN1 and 12		
Cablas	Data – up to 50m long : 22 x 0.5 mm², unshielded,		
Cables	Supply -2 x 1mm ² , check voltage drop		
Waiting time between			
2 motion tasks	depends on the response time of the control system		
Addressing time (minimum)	4ms		
Starting delay (maximum)	2ms		
Response time of digital			
	max. 10ms		

10.1.2.3 LEDs

outputs

Two LEDs are mounted next to the terminals on the expansion card. The green LED signals that the 24V auxiliary supply is available for the expansion card. The red LED signals faults in the outputs from the expansion card (overload of switching components, short-circuit).

10.1.2.4 Entering a motion block number (example)

Motion block number	A7	A6	A5	A4	A3	A2	A1	A0
binary 1010 1110	1	0	1	0	1	1	1	0
decimal 174	128	_	32	-	8	4	2	_

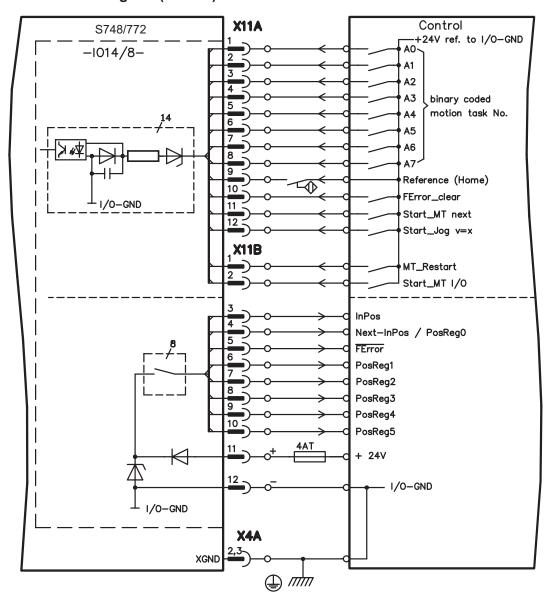

10.1.2.5 Connector assignments

The functions are adjustable with the setup software. In the table below the default values are described.

Con	Connector X11A					
Pin	Dir	Default function	Description			
1	In	A0	Motion block number, LSB			
2	In	A1	Motion block number, 2 ¹			
3	In	A2	Motion block number, 2 ²			
4	In	A3	Motion block number, 2 ³			
5	In	A4	Motion block number, 2 ⁴			
6	In	A5	Motion block number, 2 ⁵			
7	In	A6	Motion block number, 2 ⁶			
8	In	A7	Motion block number, MSB			
9 In		Reference	Polls the home switch. If a digital input on the base unit is			
	In		used as a home input, then the input on the expansion card			
			will not be evaluated.			
10	10 In F	F_error_clear	Clears the warning of a following error (n03) or the response			
10	1111	ii F_eiroi_cleai	monitoring (n04)			
	ln		The following task, that is defined in the motion task by "Start			
11			with I/O" is started. The target position of the present motion			
			task must be reached before the following task can be started.			
			The next motion block can also be started by an appropriately			
			configured digital input on the base unit.			
	ln		Starts the "Jog Mode" with a defined speed. "x" is the speed			
12			saved in the servo amplifier for the function "Jog Mode". A ri-			
			sing edge starts the motion, a falling edge cancels the motion.			

Cor	Connector X11B				
1	In	MT_Restart	Continues the motion task that was previously interrupted.		
2	In	Start_MT I/O	Starts the motion task that is addressed by A0-A7 (connector X11A/18).		
3	Out	InPos	When the target position for a motion task has been reached (the InPosition window), this is signaled by the output of a HIGH signal. A cable break will not be detected.		
4	Out	Next-InPos	The start of each motion task in an automatically executed sequence of motion tasks is signaled by an inversion of the output signal. The output produces a LOW signal at the start of the first motion task of the sequence. The form of the message can be varied by using ASCII commands.		
		PosReg 0	Can only be adjusted by ASCII commands/setup software.		
5	Out	F_error	A LOW signal indicates that the position has gone outside the acceptable following error window.		
6	Out	PosReg1	default: SW limit 1, indicated by a HIGH signal		
7	Out	PosReg2	default: SW limit 2, indicated by a HIGH signal		
8	Out	PosReg3	Can only be adjusted by ASCII commands/setup software.		
9	Out	PosReg4	Can only be adjusted by ASCII commands/setup software.		
10	Out	PosReg5	Can only be adjusted by ASCII commands/setup software.		
11	-	24V DC	Supply voltage for output signals.		
12	-	I/O-GND	Digital GND for the control system.		

10.1.2.6 Connection diagram (default)

10.1.3 Expansion card -PROFIBUS-

This section describes the PROFIBUS expansion card for the S748/772. Information on the range of functions and the software protocol can be found in our manual "Communication Profile PROFIBUS DP"..

The PROFIBUS expansion card has two 9-pin SubD sockets wired in parallel. The supply voltage for the expansion card is provided by the servo amplifier.

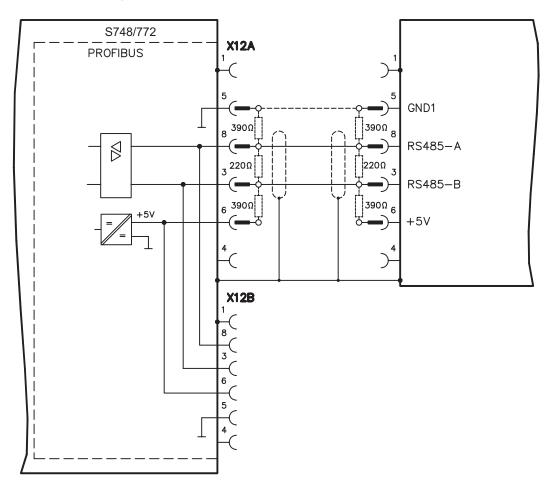

10.1.3.1 Front view

10.1.3.2 Connection technology

Cable selection, cable routing, shielding, bus connector, bus termination and transmission times are all described in the "Installation Guidelines for PROFIBUS-DP/FMS" from PNO, the PROFIBUS User Organization.

10.1.3.3 Connection diagram

10.1.4 Expansion card -SERCOS-

This section describes the SERCOS expansion card for S748/772. Information on the range of functions and the software protocol can be found in our manual "IDN Reference Guide SERCOS".

10.1.4.1 Front view

10.1.4.2 LEDs

RT	Indicates whether SERCOS telegrams are being correctly received. In the final Communication Phase 4 this LED should flicker, since cyclical telegrams are being received.
тт	Indicates that SERCOS telegrams are being transmitted. In the final Communication Phase 4 this LED should flicker, since cyclical telegrams are being transmitted. Check the station addresses for the controls and the servo amplifier if: - the LED never lights up in SERCOS Phase 1 or - the axis cannot be operated, although the RT LED is lighting up cyclically.
ERR	Indicates that SERCOS communication is faulty or suffering from interference. If this LED is very bright, then communication is suffering strong interference, or is non-existent. Check the SERCOS transmission speed for the controls and the servo amplifier (BAUD RATE) and the fiber-optic connection. If this LED fades or flickers, this indicates a low level of interference for SERCOS
	communication, or the optical transmitting power is not correctly matched to the length of cable. Check the transmitting power of the (physically) previous SERCOS station. The transmitting power of the servo amplifier can be adjusted in the setup software DRIVEGUI.EXE on the SERCOS screen page, by altering the length parameter for the cable length.

10.1.4.3 Connection technology

For the fiber optic cable connection, only use SERCOS components to the SERCOS Standard IEC 61491.

Receive data

The fiber optic cable carrying receive data for the drive in the ring structure is connected to X13 with an F-SMA connector.

Transmit data

Connect the fiber optic cable for the data output to X14 by F-SMA connector.

10.1.4.4 Connection diagram

The SERCOS II bus system has ring topology, with fiber optical cables.

10.1.4.5 Modifying the station address

The drive address can be set to a value between 0 and 63. With address 0, the drive is assigned as an amplifier in the SERCOS ring. Set the station address with the:

Keys on the front of the servo amplifier

The SERCOS address can be modified using the keys on the front of the amplifier (see p. 100).

Setup software

The address can also be modified in the setup software, "CAN/Fieldbus" screen (please refer to the setup software online help). Alternatively, enter the command **ADDR #** in the "Terminal" screen, where # is the new address of the drive.

10.1.4.6 Modifying the baud rate and optical power

If the baud rate is not set correctly, communication is not possible.

The **SBAUD** # parameter can be used to set the baud rate, where # is the baud rate. If the optical power is not set correctly, errors occur in telegram transmission and the red LED on the drive lights up. During normal communication, the green send and receive LEDs flash, giving the impression that the relevant LED is on.

The **SLEN** # parameter can be used to specify the optical range for a standard 1 mm² glass fibre cable, where # is the length of the cable in metres.

SBAUD			SLEN		
2	2 Mbaud	0	Very short connection		
4	4 Mbaud	1< 15	Length of the connection with a 1 mm ² plastic cable		
8	8 Mbaud	15< 30	Length of the connection with a 1 mm ² plastic cable		
16	16 Mbaud	≥ 30	Length of the connection with a 1 mm ² plastic cable		

Setup software

The parameters can be modified in the setup software, "SERCOS" screen (please refer to the setup software the online help). Alternatively, the commands **SBAUD** # and **SLEN** # can be entered in the "Terminal" screen.

10.1.5 Expansion card - DEVICENET -

This section describes the DeviceNet expansion card for S748/772. Information on the range of functions and the software protocol can be found in our manual "DeviceNet Communication Profile".

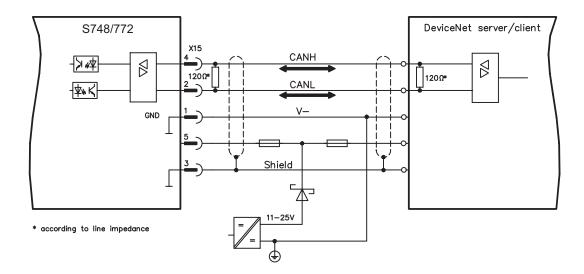

10.1.5.1 Front view

10.1.5.2 Connection technology

Cable selection, cable routing, shielding, bus connector, bus termination and transmission times are all described in the "DeviceNet Specification, Volume I, II", published by ODVA.

10.1.5.3 Connection diagram

10.1.5.4 Combined module/network status-LED

LED	Meaning
	The device is not online.
off	 The device has not yet finished the Dup_MAC_ID test.
	- The device is possibly not yet switched on.
a. K. a. c. ta	The device is operating as normal, is online, and the connections have been
green	established. The device has been assigned to a master.
	The device is operating as normal, is online, but the connections have not
	been established.
blinking	 The device has passed the Dup_MAC_ID test and is online, but the
green	connection to other nodes have not been established.
	- This device has not been assigned to a master.
	- Missing, incomplete or wrong configuration.
blinking	An error that can be cleared and/or at least one I/O connection are in a waiting
red	state.
	- An error has occurred that cannot can be cleared; it may be necessary to
	replace the device.
red	- Communication device failure. The device has detected a fault that
	prevents communication with the network (for instance, a MAC ID appears
	twice or BUSOFF).

10.1.5.5 Setting the station address (device address)

The station address for the servo amplifier can be set in three different ways:

- Set the rotary switches at the front of the expansion card to a value between 0 and 63. Each switch represents a decimal figure. For example, to set the address for the drive to 10, set MSD to 1 and LSD to 0.
- Set the rotary switches at the front of the expansion card to a value higher than 63.
 Now you can set up the station address by using the ASCII commands DNMACID x, SAVE, COLDSTART, whereby "x" stands for the station address.
- Set the rotary switches at the front of the expansion card to a value higher than 63. Now you can set up the station address by using the DeviceNet Object (Class 0x03, Attribute 1). This is normally carried out with the help of a DeviceNet software setup tool. You must save the parameters in non-volatile memory (Class 0x25, Attribute 0x65) and then restart the drive after setting/altering the address.

10.1.5.6 Setting the transmission speed

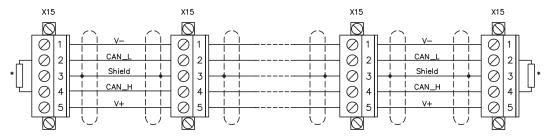

The DeviceNet transmission speed can be set in three different ways:

- Set the rotary switch for Baud rate (at the front of the option card) to a value between 0 and 2. 0 = 125 kbit/s, 1 = 250 kbit/s, 2 = 500 kbit/s.
- Set the rotary switch for Baud rate (at the front of the option card) to a value higher than 2. Now you can set the Baud rate by using the terminal commands DNBAUD x, SAVE, COLDSTART, whereby "x" stands for 125, 250 or 500.
- Set the rotary switch for Baud rate (at the front of the option card) to a value higher than 2. Now you can set the Baud rate by using the DeviceNet Object (Class 0x03, Attribute 2) to a value between 0 and 2. This is normally carried out with the help of a DeviceNet software setup tool. You must save the parameters in non-volatile memory (Class 0x25, Attribute 0x65) and then restart the drive after altering the baud rate.

10.1.5.7 Bus cable

To meet ISO 11898, a bus cable with a characteristic impedance of 120 Ω should be used. The maximum usable cable length for reliable communication decreases with increasing transmission speed. As a guide, you can use the following values which we have measured, but they are not to be taken as assured limits.

General characteristic	Specification
Bit rates	125 kbit, 250 kbit, 500 kbit
Distance with larger	500 meters at 125 kBaud
Distance with larger	250 meters at 250 kBaud
bus connections	100 meters at 500 kBaud
Number of nodes	64
Signal environment	CAN
Modulation	Basic bandwidth
Coupling medium	DC-coupled differential transmit/receive operation
Isolation	500 V (option: optocoupler on the transceiver's node side)
Typical differential input im-	Shunt C = 5pF
pedance (recessive state)	Shunt R = $25K\Omega$ (power on)
NAir differential investigan	Shunt C = 24pF + 36 pF/m of the permanently
Min. differential input impe-	attached stub cable
dance (recessive state)	Shunt R = 20 K Ω
	-25 V to +18 V (CAN_H, CAN_L)
A baselute many	The voltages for CAN_H and CAN_L refer to the ground pin
Absolute max.	of the transceiver. The voltage is higher than that on the
voltage range	V-terminal by the amount of the forward voltage drop of the
	Schottky diode. This voltage drop must be < 0.6V.

* according to line impedance about $120\,\Omega$

Grounding:

The DeviceNet network must only be grounded at one point, to avoid ground loops. The circuitry for the physical layer in all devices are referenced to the V-bus signal. The ground connection is made via the power supply for the bus system. The current flowing between V- and ground must not flow through any device other than the power supply.

Bus topology:

The DeviceNet medium utilizes a linear bus topology. Termination resistors are required at each end of the connecting cable. Stub cables are permitted up to a length of 6 meters, so that at least one node can be connected.

Termination resistors:

DeviceNet requires a termination at each end of the connecting cable.

These resistors must meet the following requirements: 120Ω , 1% metal-film, 1/4 W

10.1.6 Expansion card -SYNQNET-

This section describes the SynqNet expansion card for S748/772. Information on the range of functions and the software protocol can be found in the SynqNet documentation.

10.1.6.1 Front view

10.1.6.2 NODE ID Switch

With these hexadecimal switches you can set the main and low significant bytes of the Node ID seperately. SynqNet does not require an address for correct operation in the network, however in some machines this can be a convenient way of identifying build options to the application program.

10.1.6.3 Node LED table

LED#	Name	Function
LED4 areas	LINIZ INI	ON = receive valid (IN port)
LED1, green	LINK_IN	OFF= not valid, power off, or reset.
		ON = network cyclic
LED2, yellow	CYCLIC	BLINK = network not cyclic
		OFF = power off, or reset
LED2 areas	LINK OUT	ON = receive valid (OUT port)
LED3, green	LINK_OUT	OFF = not valid, power off, or reset
		ON = repeater on, network cyclic
LED4, yellow	REPEATER	BLINK = repeater on, network not cyclic
		OFF = repeater off, power off, or reset

10.1.6.4 SynqNet Connection, Connector X21B/C (RJ-45)

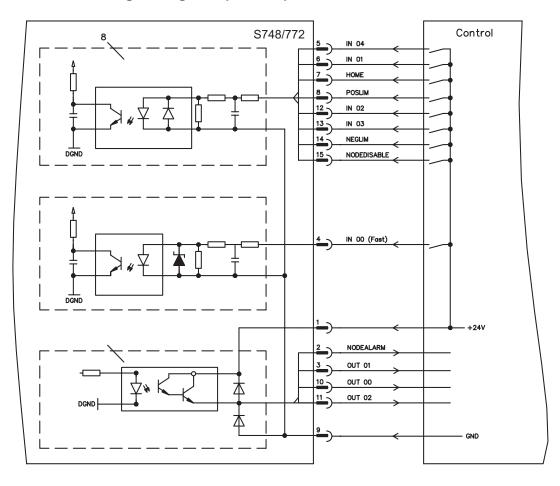

Connection to the SynqNet network via RJ-45 connectors (IN and OUT ports) with integrated LEDs.

10.1.6.5 Digital inputs/outputs, connector X21A (SubD 15-pin, socket)

Inputs (In): 24V (20...28V), opto-isolated, one high-speed input (Pin 4) Outputs (Out): 24V, opto-isolated, Darlington driver

10.1.6.6 Connection diagram digital inputs/outputs, connector X21A

10.2 Expansion cards for slot 2

10.2.1 Guide to installation of expansion cards in slot 2

The method of installing the expansion card in slot 2 is the same as that described for slot 1 (see p.105).

- Remove the **lower** crosshatched area of the front film (labelled slot 2).
- Lever out the cover plates under the film.
- Push the expansion card into the slot.
- Use the screws provided to fasten the front plate of the expansion card in place.

Boundary of SLOT 2

10.2.2 Option "F2", controlled Fan

To reduce noise emission the servo amplifiers can be ordered with the built-in option card F2. This option cannot be built-in later. The F2 option card fits to slot2 or 3 (see part number scheme on p.20).

Option card F2 can be used combined with a card in slot 1 even if it is plugged to slot 2!

Function

The fan is switched on and off or runs with 50% rated speed depending on temperature values. That reduces the average noise emission.

Switching temperature

Monitoring	Fan off	Fan ~50%	Fan on
Internal temperature	< 55°C	~ 58°C	>65°C
Heat sink temperature	< 70°C	~ 75°C	> 85°C

10.2.3 Expansion card "Posl/O" and "Posl/O-Monitor"

The "Posl/O" and "Posl/O-Monitor" expansion cards can be pushed into slot2 or 3.

This expansion card **PosI/O** provides an extra SubD connector (X5) with high-speed, bidirectional digital 5 V inputs/outputs. The setup software can be used to preset various input and output functions, e.g.:

- Position encoder emulation (ROD- or SSI-compatible)
- Input for high-speed 5 V RS485 signals (electronic gearing, master-slave operation) Further details can be found in sections 8.12 "Feedback" and 8.13 "Electronic gearing, master-slave operation".

This expansion card **"PosI/O-Monitor"** provides an extra connector X3C with analog +/-10V Inputs and Outputs (see page 125, chapter "Analog I/O"). Functionality can be set with the setup software or with macro functions.

10.2.3.1 Front views

10.2.3.2 Feedback

10.2.3.2.1 ROD (AquadB) 5V (X5, X1)

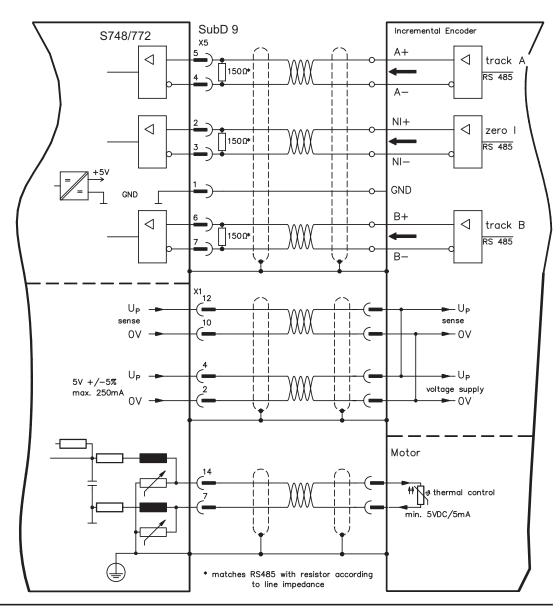

A 5V incremental encoder (AquadB) can be used as standard motor feedback (primary and secondary, ⇒ p.59). Every time the 24V auxiliary voltage is switched on, the amplifier need start-up information for the position controller (parameter value MPHASE). Depending on the feedback type either wake&shake is executed or the value for MPHASE is read out of the amplifier's EEPROM.

▲ WARNING

With vertical load the load could fall during wake&shake, because the brake is not active and torque is not sufficient to hold the load. Don't use this feedback type with vertical load (hanging load).

The power supply for the encoder and thermal control in the motor is connected to X1. If lead lengths of more than 50m are planned please consult our customer service. Frequency limit (A, B, N): 1.5 MHz

Туре	FBTYPE	EXTPOS	GEARMODE	Remarks
AquadB 5V	13	3	3	MPHASE from EEPROM
AquadB 5V	19	3	3	MPHASE wake & shake

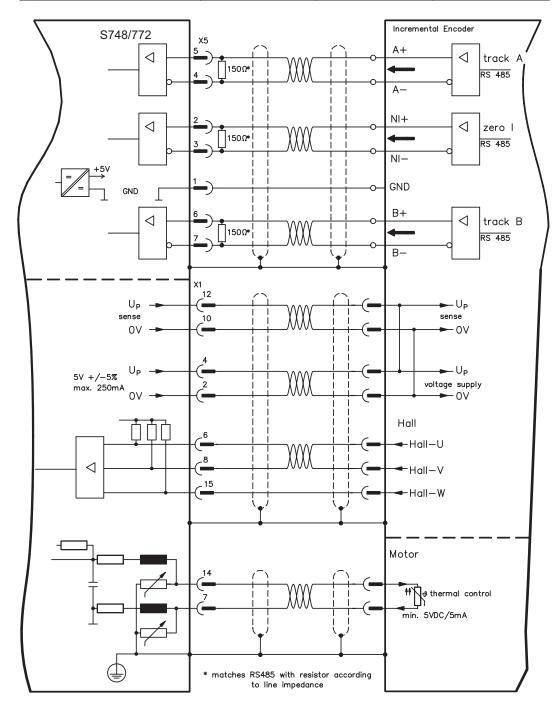

10.2.3.2.2 ROD (AquadB) 5V with Hall (X5, X1)

Wiring of a 5V incremental encoder (ROD, AquadB) with Hall sensors as a feedback unit (primary, ⇒ p.59). For the commutation hall sensors are used and for the resolution an incremental encoder.

The power supply for the encoder and thermal control in the motor is connected to X1 and evaluated there.

If cable lengths of more than 25m are planned, please consult our customer service. Frequency limit X5: 1.5 MHz, X1: 350 kHz

Туре	FBTYPE	EXTPOS	GEARMODE
AquadB 5V with Hall	18	-	-

10.2.3.2.3 SSI Encoder (X5, X1)

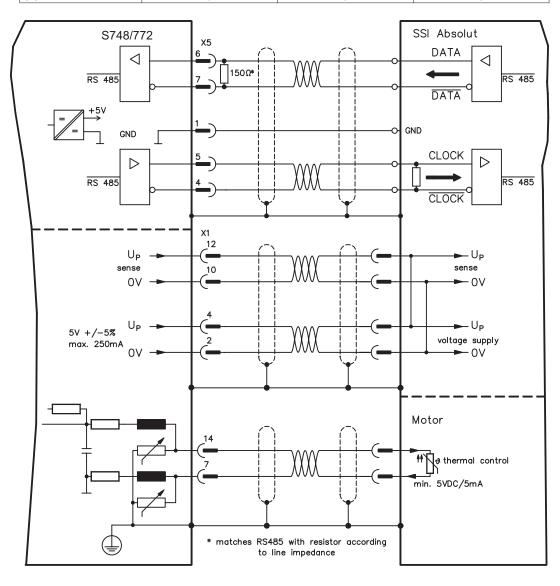

Wiring of a synchronous serial absolute-encoder as a feedback system (primary or secondary, \Rightarrow p.59). The signal sequence can be read in **Gray** code or in **Binary** (standard) code.

The power supply for the encoder and thermal control in the motor is connected to X1 and evaluated there.

If cable lengths of more than 50m are planned, please consult our customer service.

Frequency limit: 1.5 MHz

Туре	FBTYPE	EXTPOS	GEARMODE
SSI	9	5	5

10.2.3.3 Electronic gearing, Master-Slave operation

10.2.3.3.1 Connection to a S748/772 master, 5V signal level (X5)

You can link several S748/772 amplifiers together in master-slave operation.

Master: position autput to X5 (screen page "Encoder emulation")

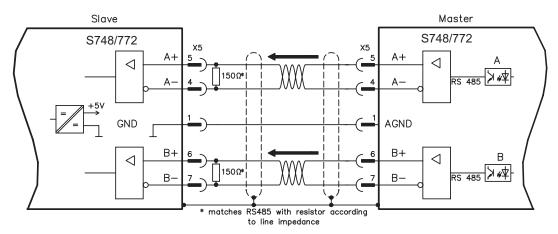

Slave: screen page "Electronic gearing" (GEARMODE)

Up to 16 slave amplifiers can be controlled by the master, via the encoder output. The SubD connector X5 is used for this purpose.

Frequency limit: 1.5 MHz

Example for Master-Slave operation with two S748/772 amplifiers:

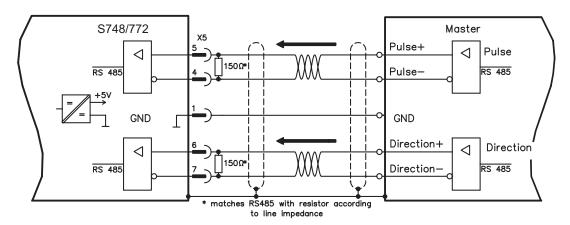

Slave **GEARMODE**: 3 Master **ENCMODE**:1

10.2.3.3.2 Connection to stepper motor controllers with 5 V signal level (X5)

Wiring of the servo amplifier (SubD connector X5) to a stepper-motor controller with a 5 V signal level. Frequency limit: 1.5 MHz

Туре	FBTYPE	EXTPOS	GEARMODE
Step/Direction 5V	-	-	4

10.2.3.4 Encoder-Emulation

10.2.3.4.1 Incremental encoder output - A quad B (X5)

Fast incremental encoder interface. Select encoder function ROD (A Quad B) Encoder ("Encoder Emulation" screen page). The servo amplifier calculates the motor shaft position from the cyclic- absolute signals of the resolver or encoder, generating incremental-encoder compatible pulses from this information. Pulse outputs on the SubD connector X5 are 2 signals, A and B, with 90° phase difference (i.e. in quadrature, hence the alternative term "A quad B" output), with a zero pulse.

The resolution (before multiplication) can be set by the RESOLUTION function:

Enc. function (ENCMODE)	Feedback system	Resolution (lines)	Zero pulse (NI)
	2 mala Dagahyar	2564096	once per turn
BOD (1)	2 pole Resolver	2304090	(only at A=B=1)
ROD (1)	Encoder	256524288	once per turn
		(2 ⁸ 2 ¹⁹)	(only at A=B=1)
	Encoder	2 ² 2 ⁷ (multiplica-	encoder signal
ROD interpolation (3)		tion) TTL line x en-	passed through
		coder resolution	from X1 to X5

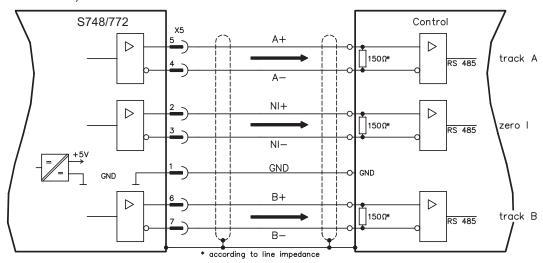

Use the NI-OFFSET parameter to adjust + save the zero pulse position within one mechanical turn. The drivers operate off an internal supply voltage.

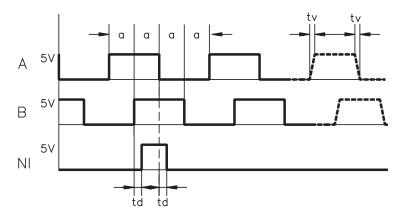

The maximum permissible cable length is 100 meters.

Connections and signals for the incremental encoder interface :

Default count direction: UP when the motor shaft is rotating clockwise (looking at the shaft's end)

Edge spacing a \geq 0.20 μs Edge steepness tv \leq 0.1 μs Delay NI-td \leq 0.1 μs $|\Delta U| \geq 2V/20 mA$

10.2.3.4.2 SSI encoder output (X5)

SSI interface (synchronous serial absolute-encoder emulation). Select encoder function SSI ("Encoder Emulation" screen page). The servo amplifier calculates the motor shaft position from the cyclic-absolute signals of the resolver or encoder. From this information a SSI date (Stegmann patent specification DE 3445617C2) is provided. Max 32 bits are transferred. The leading data bit contains the number of revolutions and are selectable from 12 to 16 bits. The following max. 16 bits contain the resolution and are not variable.

The following table shows the allocation of the SSI date depending upon selected number of revolutions:

	Revolution								Resolution (variable)																							
SSIREVOL																																
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
Bit		14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
<u> </u>			13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
				12	11	10	9	8	7	6	5	4	3	2	1	0																
					11	10	9	8	7	6	5	4	3	2	1	0																

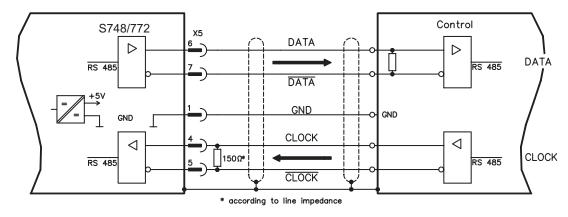

The signal sequence can be output in **Gray** code or in **Binary** (standard) code.

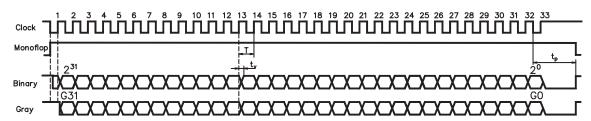

The servo amplifier can be adjusted to the clock frequency of your SSI-evaluation with the setup software (cycle time 1.3 μ s or 10 μ s).

The drivers operate off an internal supply voltage.

Connection and signals for the SSI interface:

Default count direction: UP when the motor shaft is rotating clockwise (looking at the end of the motor shaft)

Switch over time Data $t_v \leq 300 nsec$ Period T = 600 ns

Time Out $t_p = 1.3 \mu s / 10 \mu s$ (SSITOUT)

Output $|\Delta U| \ge 2V/20mA$ Input $|\Delta U| \ge 0.3V$

10.2.3.5 Analoge Inputs and Outputs

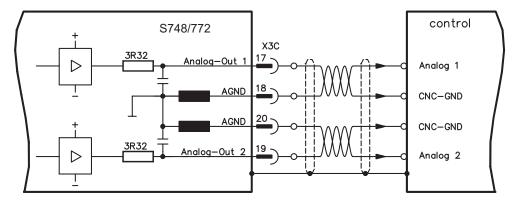

The expansion card "Posl/O-Monitor" adds analog inputs and outputs to the servo amplifier were pre-programmed signals can be assigned to. A listing of these pre-programmed functions can be found on the screen page "Analog I/O" of the setup software.

10.2.3.5.1 Analoge Output ANALOG-OUT 1 and 2

You can use terminals X3C/17 (Analog-Out 1) respectively X3C/19 (Analog-Out 2) to deliver analog values converted from internal digital values (e.g. tachometer voltage).

Technical characteristics

- Reference ground is Analog-GND (AGND, terminal X3C/18 and X3C/20)
- Spezification according to EN 61131-2 table 11
- Output voltage ±10 V
- Resolution: ±16 Bit

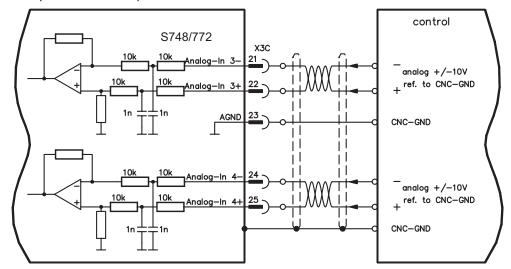

10.2.3.5.2 Analog Inputs ANALOG-IN 3 and 4

You can use terminals X3C/21-22 (Analog-In 3) respectively terminal X3C/24-25 (Analog-In 4) with several pre-programmed functions (e.g. adjustable current limitation).

Technical characteristics

- Differential input voltage max. ± 10 V
- Resolution 1.25 mV, 16 bits, scalable
- Ground reference AGND, terminal X3C/23
- Input resistance 20 kΩ
- Common-mode voltage range for both inputs ± 10 V
- Update rate 62.5 μs

10.3 Expansion cards for slot 3

10.3.1 Guide to installation of expansion cards in slot 3

The method of installing the expansion card in slot 3 is the same as that described for slot 1 (see p.105).

- Remove the area of the front film coloured yellow (labelled slot 3).
- Lever out the cover plates under the film.
- Remove the small PCB which is plugged into slot. Use suitable pliers.
- Push the expansion card into the slot.
- Use the screws provided to fasten the front plate of the expansion card in place.

10.3.2 Option "F2", controlled Fan

To reduce noise emission the servo amplifiers can be ordered with the built-in option card F2. This option cannot be built-in later. The F2 option card fits to slot2 or 3 (see part number scheme on p.20).

Function

The fan is switched on and off or runs with 50% rated speed depending on temperature values. That reduces the average noise emission.

Switching temperature

Monitoring	Fan off	Fan 50%	Fan on
Internal temperature	< 55°C	~ 58°C	>65°C
Heat sink temperature	< 70°C	~ 75°C	> 85°C

10.3.3 Expansion card "Posl/O" and "Posl/O-Monitor"

The "Posl/O" and "Posl/O-Monitor" expansion cards can be pushed into slot2 or 3. This expansion card **Posl/O** provides an extra SubD connector (X5) with high-speed, bidirectional digital 5 V inputs/outputs. The setup software can be used to preset various input and output functions, e.g.:

- Position encoder emulation (ROD- or SSI-compatible)
- Input for high-speed 5 V RS485 signals (electronic gearing, master-slave operation) This expansion card **"Posl/O-Monitor"** provides an extra connector X3C with analog +/-10V Inputs and Outputs. Functionality can be set with the setup software or with macro functions.

A detailled description of the interfaces can be found from page 118.

10.3.4 Expansion card "Safety 2" (in process)

This expansion card (Basic version) includes various safety functions for the safe operation of drive shafts. Rotatory snchronous motors are allowed when using this safety card.

All functions fulfill the safety requirements SIL2 according to IEC 62061 respectively performance level "d" according to ISO 13849-1.

10.3.4.1 **Safety Notes**

A CAUTION The user documentation of the safety card must be considered.

10.3.4.2 Front view

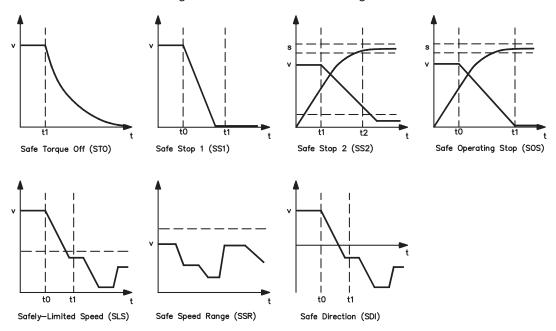

10.3.4.3 Safe inputs/outputs

	Pin	I/O	Signal	Description
SS1 Activate	1	I	1->0	activates function SS1
SS2 Activate	2	I	1->0	activates function SS2
SOS Activate	3	I	1->0	activates function SOS
SLS Activate	4	I	1->0	activates function SLS
STO Acknowledge	5	0	0->1	Status: STO activated
SOS Acknowledge	6	0	0->1	Status: SOS activated
SDI Acknowledge	7	0	0->1	Status: SDI activated
SRA Acknowledge	8	0	0->1	Status: SSR activated
24V Supply	10	-	-	24V supply of digital outputs
SSR Activate	12	I	1->0	activates function SSR
SDI Neg Activate	13	I	1->0	activates function SDI (ccw rotation)
SDI Pos Activate	14	I	1->0	activates function SDI (cw rotation)
Ready Acknowledge	16	0	0->1	Message "Safety card is ready to operate"
Reset	20	I	1->0	Input for Reset
0V Supply	21	-	-	0V supply of digital outputs

10.3.4.4 Safe drive functions

The safety functions are selected/activated using the digital inputs on the expansion card. All funtions fulfill the safety requirements SIL2 according to IEC 62061 respectively performance level "d" according to ISO 13849-1. The following functions are available::

Safe Torque Off (STO)

With the STO function, the power supply to the motor is interrupted safely directly in the drive. This corresponds to an uncontrolled braking in accordance with IEC 60204-1, category 0.

Safe Stop 1 (SS1)

With the SS1 function, the drive is stopped by controlled braking and then the power supply to the motor is interrupted safely. This corresponds to an uncontrolled braking in accordance with IEC 60204-1, category 1.

Safe Stop 2 (SS2)

With the SS2 function, the drive is stopped by controlled braking and then remains at a controlled standstill. This corresponds to a controlled braking in accordance with IEC 60204-1, category 2.

Safe Operating Stop (SOS)

The SOS function monitors the stop position reached and prevents any deviation outside a defined range.

Safely Limited Speed (SLS)

The SLS function monitors the drive to ensure that it maintains a defined speed.

Safe Speed Range (SSR)

The SSR function checks the current speed of the drive against a maximum limiting value.

Safe Direction (SDI)

The SDI function ensures that the drive can only move in one (defined) direction.

10.3.5 **Expansion card "Safety 1" (in process)**

This expansion card includes all available safety functions. Rotatory snchronous motors are allowed when using this safety card. All functions fulfill the safety requirements SIL3 according to IEC 62061 respectively performance level "e" according to ISO 13849-1.

10.3.5.1 **Safety Notes**

▲ CAUTION The user documentation of the safety card must be considered.

10.3.5.2 Front view

10.3.5.3 Safe inputs/outputs

	Pin	I/O	Signal	Description
SS1 Activate	1	I	1->0	activates function SS1
SS2 Activate	2	I	1->0	activates function SS2
SOS Activate	3	I	1->0	activates function SOS
SLS Activate	4	I	1->0	activates function SLS
STO Acknowledge	5	0	0->1	Status: STO activated
SOS Acknowledge	6	0	0->1	Status: SOS activated
SDI Acknowledge	7	0	0->1	Status: SDI activated
SRA Acknowledge	8	0	0->1	Status: SSR activated
SBT Acknowledge	9	0	0->1	Status: Brake test done
24V Supply	10	-	-	24V supply of digital outputs
Encoder Supply	11	-	-	Supply for external encoder
SSR Activate	12	ı	1->0	activates function SSR
SDI Neg Activate	13	I	1->0	activates function SDI (ccw rotation)
SDI Pos Activate	14	I	1->0	activates function SDI (cw rotation)
SBT Activate	15	I	1->0	activates function SBT
Ready Acknowledge	16	0	0->1	Message "Safety card is ready to operate"
SBC+	17	0		Control external brake +
SBC-	18	0		Control external brake -
STO SIL3	19	0	0->1	Single pole output
SS1 SIL3/Reset	20	I	1->0	Input for SIL3 and Reset
0V Supply	21	-	-	0V supply of digital outputs
0V Encoder Supply	22	-	_	0V supply for external encoder

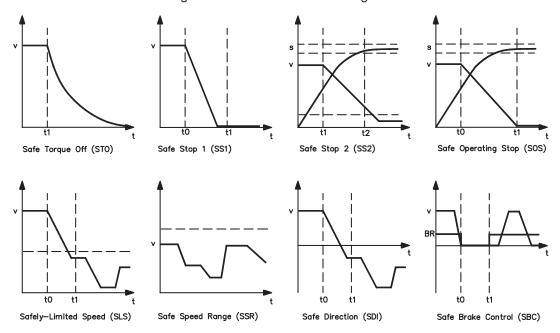

10.3.5.4 **External encoder**

Incremental encoders (TTL) or encoders with SSI signals can be connected to X31.

X31 Pin	Incremental encoder	SSI Encoder (in process)
1	Channel A+	Clock +
2	Channel B+	Data +
3	Reference Z+	n.c.
4	Supply U+	Supply U+
5	Schirm	n.c.
6	Channel A-	Clock-
7	Channel B-	Data-
8	Reference Z-	n.c.
9	Supply 0 V	Supply 0 V

10.3.5.5 Safe drive functions

The safety functions are selected/activated using the digital inputs on the expansion card. All functions fulfill the safety requirements SIL3 according to IEC 62061 respectively performance level "e" according to ISO 13849-1. The following functions are available:

Safe Torque Off (STO)

With the STO function, the power supply to the motor is interrupted safely directly in the drive. This corresponds to an uncontrolled braking in accordance with IEC 60204-1, category 0.

Safe Stop 1 (SS1)

With the SS1 function, the drive is stopped by controlled braking and then the power supply to the motor is interrupted safely. This corresponds to an uncontrolled braking in accordance with IEC 60204-1, category 1.

Safe Stop 2 (SS2)

With the SS2 function, the drive is stopped by controlled braking and then remains at a controlled standstill. This corresponds to a controlled braking in accordance with IEC 60204-1, category 2.

Safe Operating Stop (SOS)

The SOS function monitors the stop position reached and prevents any deviation outside a defined range.

Safely Limited Speed (SLS)

The SLS function monitors the drive to ensure that it maintains a defined speed.

Safe Speed Range (SSR)

The SSR function checks the current speed of the drive against a maximum limiting value.

Safe Direction (SDI)

The SDI function ensures that the drive can only move in one (defined) direction.

Safe Brake Control (SBC)

An external mechanical brake can be controlled by the 2 poles output "SBC+/SBC" of the safety card. SBC will become active with STO.

Safe Brake Test (SBT)

The safety function SBT can be used for testing the external mechanical brake and the internal motor holding brake.

11	Appendix	
11.1	Glossary	
В	Brake circuit	Converts superfluous energy fed back by the motor during braking (regenerated energy) into heat.
С	Clock	Clock signal
	Common-mode voltage	The maximum amplitude of a disturbance (on both inputs) which a differential input can eliminate
	Counts	Internal count pulses, 1 pulse = 1/2 ²⁰ turn ⁻¹
	Continuous power of brake circuit	Mean power that can be dissipated in the brake circuit
	Current controller	Regulates the difference between the current setpoint and the actual value to 0 Output: power output voltage
D	DC bus link	Rectified and smoothed power voltage
	Disable	Removal of the ENABLE signal
E	Earth short	electrical connection between a phase and the protective earth (PE)
	Enable	Enable signal for the servo amplifier, Hardware-Enable with 24V signal to X3, Software-Enable command by setup Software, fieldbus or permanently set. Both are required for enabling the amplifier.
	ENABLE	Enable signal for the servo amplifier (+24 V)
F	Fieldbus interface	CANopen, PROFIBUS, SERCOS etc.
	Final speed (limit speed)	Maximum value for the speed normalization at ±10 V
G	GRAY-code	Special format for representing binary numbers
Н	Holding brake	Brake in the motor, that can only be used when the motor is at standstill
1	I ² t threshold	Monitoring of the r.m.s. current that is actually required
	Input drift	Temperature and age-dependent alteration of an analog input
	Incremental encoder interface	Position signaling by 2 signals with 90° phase difference (i.e. in quadrature), is not an absolute position output
	lpeak, peak current	The effective value of the peak current
	Irms, effective current	The r.m.s. value of the continuous current
K	Kp, P-gain	Proportional gain of a control loop
L	Limit speed (final speed)	Maximum value for speed normalization at ±10 V
	Limit switch	Switch limiting the traverse path of the machine; implemented as n.c. (break) contact

М	Machine	The complete assembly of all connected parts or devices, of which at least one is movable
	Motion block	Data packet with all the position control parameters which are required for a motion task
	Multi-axis system	Machine with several independently driven axes
N	Natural convection	Free movement of air for cooling
0	Optocoupler	Optical connection between two electrically independent systems
Р	P-controller	Control loop with purely proportional behavior
	Phase shift	Compensation for the lag between the electro- magnetic and magnetic fields in the motor
	PI-controller	Control loop with proportional and differential behavior
	Position controller	Regulates the difference between the position setpoint and the actual position to 0 Output: speed setpoint
	Potential isolation	electrically decoupled, electrical isolation
	Power contactor	System protection device with phase monitoring
	Pulse power of the brake circuit	Maximum power which can be dissipated in the brake circuit
R	Reset	New start of the microprocessor
	Resolver/digital converter	Conversion of the analog resolver signals into digital information
	Reversing mode	Operation with a periodic change of direction
	Ring core	Ferrite rings for interference suppression
	ROD-interface	Incremental position output
S	Servo amplifier	Control device for regulating the speed, torque and position of a servomotor
	Setpoint ramps	Limits for the rate of change of the speed setpoint
	Short-circuit	here: electrically conductive connection between two phases
	Speed controller	Regulates the difference between the speed setpoint and the actual value to 0 Output: current setpoint
	SSI-interface	Cyclically absolute, serial position output
	Supply filter	Device to divert interference on the power supply cables to PET
	Tachometer voltage	Voltage proportional to the actual speed
	Thermal control	Temperature-sensitive device built into the motor winding (usually PTC)
	Tn, I-integration time	Integral component of a control loop
Z	Zero pulse	Output once per turn from incremental encoders, used to zero the machine

11.2 Order codes

The order numbers of accessories such as cables, brake resistors, mains supplies, etc., can be found in the accessories manual (CDROM or website).

11.2.1 Servo amplifiers

Article (standard version)*	EU order code	US order code
